Chapter 1 .Introduction

This tractor workshop manual is for qualified service personnel engaged in servicing and overhauling T455/T555 tractor. Use of this publication is not recommended for field operators since they usually do not have access to special tools and shop equipment essential for most servicing.

Servicing procedures outlined herein contain sufficient information to return all component parts of a tractor to new condition. In discussion of each component parts, it is assumed that a complete overhaul has been performed, consequently, complete disassembly and reassembly are outlined. The mechanic is relied upon to decide how far disassembly must be carried when complete overhaul is not required.

Study unfamiliar service procedures thoroughly and clearly understood before attempting disassembly. Specific data essential for proper overhaul, such as running clearances and torque values, have been provided in interline of Inspection and reassembly procedures of each group section.

This manual was compiled from latest information available at time of publication.

Manufacturer reserves the right to make changes at any time without notice.

Whenever the terms "left" and "right" are used, They means as viewed by the operator when seated in the operator's seat.

SAFETY INSTRUCTION

ALWAYS PRACTICE SAFETY BY THINKING BEFORE ACTION AVOID FIRE HAZARDS.

- Keep fire extinguishers easily available and in good operating condition.
- All relevant personnel should know how to operate fire fighting equipment.
- Keep a first aid kit in an easily accessible location.
- Do not smoke while handling fuel, or other highly flammable material.
- Do not use an open pail for transporting fuel.
- Use of an approved fuel container.
- Dispose of all fuel-soaked rags in covered containers where cigarettes cannot be dropped carelessly.
- Do not smoke and avoid open flame when charging, jumping, or boosting batteries.
- Batteries give off gas which is flammable and explosive.
- Do not charge batteries in a closed area. Provide proper ventilation to avoid explosion of accumulated gases. Avoid acid burns.
- Wear safety goggles when handling battery electrolyte. It contains sulfuric acid which is a poison and can cause blindness. Avoid it contacting eyes, skin, or clothing. Sulfuric acid will eat through clothing and can cause severe burns to skin.

AVOID HIGH-PRESSURE FLUIDS

- 1) Before beginning work on hydraulic system components, turn off engine and operate hydraulic control levers to relieve internal hydraulic pressure.
- 2) Oil under pressure can penetrate skin and lead to personal injury. Treat sources of oil pressure with extreme care, wearing safety goggles.
- 3) If hydraulic leak develops, correct immediately. Escaping hydraulic oil can have extremely high pressure. A stream of high pressure oil may easily penetrate skin just like modern needleless vaccination equipment, but with the exception that hydraulic fluid may cause blood poisoning. It is imperative that connections are tight and that all lines and pipes should be in good condition. If injured by escaping hydraulic fluid, see a doctor at once.

STAY CLEAR OF PTO

- 1) Entanglement in rotating drive line can cause serious injury or death.
- 2) Keep tractor master shield and drive line shield in place at all times except for special applications as directed in the implement operator's manual.
- 3) Wear fairly tight fitting clothing. Stop the engine and be sure PTO driveline is stopped before making adjustment, connections, or cleaning out PTO drive equipment.

SERVICE TIRES SAFELY

Tire changing can be dangerous and should be done by trained personnel using proper tools and equipment.

Do not re-inflate a tire that has been run flat or seriously under-inflated. Have it checked by qualified personnel.

Use wheel handling equipment adequate for weight involved when removing and installing wheels.

WARNING SIGNS IN THIS MANUAL

The following warning symbols in this manual draw additional attention to items of importance for the safe and correct operation of the tractor.

SIGN	MEANING OF SIGN
 DANGER	Serious hazard with a very high level of risk of either serious injury or death
 WARNING	Hazard or unsafe practice that can lead to severe injury or death.
 CAUTION	Hazard or unsafe practice that can lead in injury or death.
 IMPORTANT	Instructions for the correct operation of the machine which, if followed, will ensure that it performs at it's best

SAFETY SIGNS

RECOGNIZE SAFETY INFORMATION This symbol, Safety-Alert Symbol, means ATTENTION! YOUR SAFETY IS INVOLVED. The message that follows the symbol contains important information about safety. Carefully read the message	
--	---

SIGNAL WORDS. A signal word—DANGER, WARNING OR CAUTION—is used with safety alert symbol. DANGER identifies the most serious hazards. Safety signs with signal Word —DANGER OR WARNING—are typically near specific hazards. General precautions are listed on CAUTION safety signs.	DANGER WARNING CAUTION
--	---

READ SAFETY INSTRUCTION Carefully read all safety instructions given in this manual for your safety. Tempering with any of the safety devices can cause serious injuries or death. Keep all safety signs in good condition. Replace missing or damaged safety signs. Keep your tractor in proper condition and do not allow any unauthorized modifications to be carried out on the Tractor, which may impair the function/safety and affect Tractor life.	
--	--

PROTECTION CHILDREN Keep children and others away from the Tractor while operating. BEFORE YOU REVERSE - Look behind Tractor for children. - Do not let children to ride on Tractor or any implement.	
--	---

USE OF ROPS AND SEAT BELT

The Roll over Protection Structure (ROPS) has been certified to industry and/or government standards. Any damage or alteration to the ROPS, mounting hardware, or seat belt voids the certification and will reduce or eliminate protection for the operator in the event of a roll-over. The ROPS, mounting hardware, and seat belt should be checked **every service** for any evidence of damage, wear or cracks. In the event of damage or alteration, the ROPS must be replaced prior to further operation of the Tractor.

The seat belt must be worn during machine operation when the machine is equipped with a certified ROPS.

Failure to do so will reduce or eliminate protection for the operator in the event of a roll-over.

PRECAUTION TO AVOID TIPPING

Do not drive where the Tractor could slip or tip.

Stay alert for holes and rocks in the terrain, and other hidden hazards.

Slow down before you make a sharp turn.

Driving forward out of a ditch or mired condition could cause Tractor to tip over backward. Back out of these situations if possible

PARK TRACTOR SAFELY

Before working on the Tractor ;

Lower all equipment to the ground.

Stop the engine and remove the key

KEEP RIDERS OFF TRACTOR

Do not allow riders on the Tractor.

Riders on Tractor are subject to injury such as being stuck by foreign objects and being thrown off of the Tractor

HANDLE FUEL SAFELY-AVOID FIRES

Handle fuel with care; it is highly flammable. Do not refuel the Tractor while smoking or near open flame or sparks.

Always stop engine before refueling Tractors.

Always keep your tractor clean of accumulated grease, and debris.

Always clean up spilled fuel.

STAY CLEAR OF ROTATING SHAFTS

Entanglement in rotating shaft can cause serious injury or death.

Keep PTO shield in place at all times.

Wear close fitting clothing. Stop the engine and be sure PTO drive is stopped before making adjustments, connections, or cleaning out PTO driven equipment.

ALWAYS USE SAFETY LIGHTS AND DEVICES

Use of hazard warning lights and turn signals are recommended when towing equipment on public roads unless prohibited by state or local regulations.

Use slow moving vehicle (SMV) sign when driving on public road during both day & night time, unless prohibited by law

PRACTICE SAFE MAINTENANCE

Understand service procedures before doing work. Keep the surrounding area of the Tractor clean and dry. Do not attempt to service the Tractor when it is in motion. Keep body and clothing away from rotating shafts. Always lower equipment to the ground. Stop the engine. Remove the key. Let the tractor cool before any repair work is done on it. Securely support any Tractor elements that must be raised for service work.

Keep all parts in good condition and properly installed. Replace worn or broken parts. Replace damage/missing decals. Remove any buildup of grease or oil from the Tractor.

Disconnect the battery ground cable (-) before making adjustments on electrical systems or welding on the Tractor.

AVOID HIGH-PRESSURE FLUIDS

Escaping fluid under pressure can penetrate the skin causing serious injury. Keep hands and body away from pinholes and nozzles, which eject fluids under high pressure. If ANY fluid is injected into the skin. Consult your doctor immediately.

PREVENT BATTERY EXPLOSIONS

Keep sparks, lighted matches, and open flame away from the top of the battery. Battery gas can explode.

Never check battery charge level by placing a metal object across the poles.

PREVENT ACID BURNS

Sulfuric acid in battery electrolyte is poisonous. It is strong enough to burn skin, cause holes in clothing and cause blindness if found entry into eyes.

For adequate safety always;

- 1.Fill batteries in a well-ventilated area.
- 2.Wear eye protection and acid proof hand gloves
3. Avoid breathing direct fumes when electrolyte is added.
4. Do not add water to electrolyte as it may splash off causing severe burns.

If you spill acid on yourself;

- 1.Flush your skin with water.
- 2.Flush your eyes with water for 10-15 minutes.

Get medical attention immediately.

SERVICE TRACTOR SAFELY

Do not wear a necktie, scarf or loose clothing when you work near moving parts. If these items were to get caught, severe injury could result.

Remove rings and other jeweler to prevent electrical shorts and entanglement in moving parts.

WORK IN VENTILATED AREA

Do not start the Tractor in an enclosed building unless the doors & windows are open for proper ventilation, as tractor fumes can cause sickness or death. If it is necessary to run an engine in an enclosed area remove the exhaust fumes by connecting an exhaust pipe extension which vents the fumes outside the enclosed area.

Using external control

Stand well clear of the rear linkage and implements when using the hitch remote switches or injury can result from moving parts.

TRACTOR RUNAWAY

1. The Tractor can start even if the transmission is in the engaged position causing the Tractor to runaway and cause serious injury to the people standing nearby the tractor.
2. For additional safety keep the pull to stop knob (were fitted)(fuel shut off control) in fully pulled out position. Transmission in neutral position Foot brake engaged and PTO lever in disengaged position while attending to the Safety Starter Switch or any other work on Tractor.

SAFETY STARTER SWITCH

1. Clutch operated safety switch is provided on all Tractors which allow the starting system to become operational only when the Clutch pedal is fully pressed.
2. Do not By-pass this safety starter switch or work on it. Only Authorized Dealers are recommended to work on safety starter switch.
3. On some models Safety Starter switch is provided on transmission High-low shifter lever and in PTO shifter lever. The tractor can be started only if High-low shifter lever is in neutral position.

Safety Starter Switch is to be replaced after every 2000 hours/4 years, whichever is earlier

SAFETY DECALS

The following safety decals ARE INSTALLED ON THE MACHINE.

If a decal become damaged, illegible or is on the machine, replace it. The decal part number is listed in the parts lists

DECALS ON THE DASH COVER

DECALS ON THE CABIN

Part No.:1200-910-023-0

Part No.:1200-910-003-0

Part No.:1200-910-011-0

Part No.:1200-910-019-0

Part No.:1769-910-009-0

Part No.:1200-910-006-0

Part No.:1200-910-004-0

DECALS ON THE CABIN

Part No.:1200-910-015-0 Part No.:1200-910-012-0

WARNING

Do not remove radiator cap while engine is hot. Hot steam will injure you.

1200-910-015-0

CAUTION

Keep hands and clothing away from rotating fan and belts to prevent serious injury.

1200-910-012-0

Inner/Outer air Ventilation

- When grills of rear and both sides are opened, inner air will ventilate in.
- For effective use, open it when operate heater or air conditioner and close when ventilate fresh air.

1220-904-122-1

Part No.:1220-904-122-1

WARNING

Do not use the sub shift lever at "H" position when driving backward.

1200-910-001-0

Part No.:1200-910-001-0

DANGER

Do not ride except operator.

1200-910-016-0

Part No.:1200-910-016-0

CAUTION

Do not touch while the system is hot. It cause serious burns

1200-910-024-0

Part No.:1200-910-024-0

WARNING

Do not refuel the tractor while smoking or near naked flame or sparks. always stop engine before refueling tractors.

1200-910-005-0

Part No.:1200-910-005-0

Part No.:1200-910-013-0

Part No.:1200-910-011-0

WARNING

Attach implements and trailers to the tractor only using the prescribed draw-bar or hitch.

1200-910-014-0

DANGER

Rotating driveline contact can cause death. KEEP AWAY! Keep all drive line. Tractor and equipment shields in place during operation.

1200-910-013-0

Part No.:1769-910-009-0

WARNING

Stay clear of raised Boom and bucket.

1769-910-009-0

UNIVERSAL SYMBOLS

Some of the universal symbols have been shown below with an indication of their meaning

	Engine speed rev/minX100)		Pressured- open slowly		Corrosive substance
	Hours, recorded		Continuous variable		"Tortoise" Slow or minimum Setting
	Engine coolant temperature		Warning		"Hare" fast or maximum setting
	Fuel level		Hazard warning		Transmission oil pressure
	Engine Stop control		Neutral		Turn signal
	Lights		Fan		Transmission oil temperature
	Horn		Power take off engaged		parking brake
	Engine oil pressure		Power take off Disengaged		Work lamps
	Air filter		Lift arm/raise		Differential lock
	Battery charge		Lift arm/lower		See operator's manual

SECTION 1. TRACTOR TYPES AND PUNCHED IDENTIFICATION MARKS

The engine number is stamped on the left hand side of the engine block.

The chassis number is shown on the right hand side of the tractor as shown in the drawing.

1. MODEL NAME PLATE

The plate indicates the model and type of the tractor.

① VIN Number

The production I.D reference number is as shown below

①

○ TONG YANG MOOLSAN CO., LTD. ○

VIN Number []

EU Type-Approval Number e13x167/2013x00260

Category T2a Total 3350~3500 kg

A-1 950~1400 kg A-2 2100~2400 kg

	T-1	T-2	T-3

2. Engine Model Identification and serial number location.

1) Engine identification location (1)

3) Description of engine model number

Ex) 4 TNV 86 CT - KKTF

2) Engine EPA decal (2)

Note : When ordering parts or making an inquiry about the engine you are working on, be sure to include the complete model and serial numbers as shown on the engine nameplate.

This decal represents that this engine is in compliance with the U.S.EPA and California (CARB) exhaust Emission regulation.

Note : The engine number is necessary information that is requisite for the warranty registration form.

Engine number assignment standard

SPECIFICATIONS

Model: T455/T555

ENGINE

4 Cycle, Inline, Water-cooled Diesel

Model : T455(4TNV88C-KKTF)
: T555(4TNV86CT-KKTF)

No. of cylinders : 4

Displacement : T455(2,190)Liters
: T554(2,091)Liters

Bore : T455(88mm(3.5in)
: T555(86mm(3.4in)

Stroke : T455,T555(90mm(3.5in)

Compression Ratio : 19.2

Rated power (kW/rpm) : T455 – 34.3/2800 rpm
T555 – 41.1/2800 rpm

(Manufacturing rating)

Rated Speed : 2,800 rpm

High idle rpm : 2,950±10 rpm

Low idle rpm : 950 ±10 rpm

Fuel injection pump : Common Rail.

Cylinder sleeve : -

Air Cleaner : Dry Filter element,
paper element filtering type.

DPF: Horizontal External type

Firing order : 1-3-4-2-1

Accelerator : Hand & Foot Accelerator

ELECTRICAL STARTING AND LIGHTING

Battery Capacity : 12 Volt 100AH

Starter : Solenoid Engaged.
Key Start with interlock,
Neutral switch

Alternator : 12V 70A

Instrumentation : Water Temperature Gauge,
Taco meter, Hour meter,
Electrical fuel level gauge.

Lighting: Head lamps, side indicators,
Rear parking brake
& indicator light
On dash board indicators
for battery charging, turn
signal, PTO signal, Engine
oil pressure, Preheat signal.

CLUTCH

Type : Diaphragm

Outer dia. X Inner dia. : Φ260XΦ180

TRANSMISSION

Type : Synchro mesh

No. of gears : 16 forward,
16 reverse speeds
with high and low
selection lever with
Differential Lock

STEERING : Hydraulic power
(Power steering)

POWER TAKE OFF

Rear mounted : 6 splines

Diameter : 1⅜ in.(35mm)

Standard PTO : ①540

BRAKES

Foot operated, independent with provision of
inter lock for simultaneous operation. A foot
brake is fitted for parking.

Disc Diameter : Φ183mm(Φin)

Number of lining : 4 each side

Total brake thickness : 21.1mm

HYDRAULIC SYSTEM

Independent fully "Live" hydraulic pump
and separate reservoir. Position controls with
isolating & response control

Piston and cylinder Lift : 1300kgf / 1503 kgf
(at 24inch behind link end/at lower link top end)

Pump output :

Main : 15.0 cc/rev (38.3 ℓ/min)

Power Steering : 7.2 cc/rev (18.8 ℓ/min)

Delivery(93% efficiency) : liter at 2800rpm

3 point linkage : USA -Category 1
adjustable outside stabilizer

SECTION 4. PRECAUTION FOR TRACTOR OPERATION

1. INSTRUMENTS

Fig.1-4 Instruments

Note:

- Oil pressure warning light and charge light on the monitor array will light when the main switch is turned from OFF to ON.
- All lights on the panel go out automatically when the engine is started and its speed is increased to a specific level.
- Do not panic if some lights on the monitor light array do not go out while the engine is at idle speed just after its starting. They will go out automatically when the engine speed reaches as a specific level.

1) MONITOR LIGHT ARRAY

| | Low beam lamp | | PTO monitor Lamp | | Fuel Level | | Charge lamp |

2) MONITOR ARRAY (CABIN)

Fig.1-5 Monitor array (Cabin)

Fig.1-6 Working lamp switch

VENTILATION

The ventilation unit is housed in the cab ceiling.

To switch it on and adjust it, turn the electrical fan switch to the desired speed.

The cab becomes slightly pressurized when the ventilation system is in operation, so that fresh air can enter only by way of the filter installed in the rear section of the cab roof.

The fan switch can be operated only after the ignition key is inserted.

The air flow can be regulated and directed by suitable positioning of the air diffusers.

Air can be taken in fresh from outside or re-circulated from within the cab by way of the relative side inlets

Re-circulation inlets fully closed: air is taken in entirely from outside the cab through the rear grille and filtered through a paper element positioned behind the grille.

N.B-it is very important that the air diffusers never be completely closed so as to allow for a steady air flow.

To obtain greater pressurization inside the cab, it is necessary to take air from the outside, therefore the inside air re-circulating grille should be fully closed.

		5	1 0	1 5	2 0	2 5	3 0	3 5	4 0	4 5	5 0	5 5	6 0			
Transmission oil	○	●					★						●		Every 500 hours or 12months after first 50 hours	Clean hydraulic suction filter at the same time.
Clutch pedal free play	○														Check daily	Free Play:20 to 30mm
Brake pedal free play	○														Check daily	Free Play:30 to 40mm
Brake performance	○														Check daily	Interlocked brakes should work simultaneously
Lever performance	○														Check daily	Every lever should work positively
Steering wheel free play	○														Check daily	About 50mm (1.97) on circumstance
Toe-in							★							★	Check after every 300 hrs	0 to 4 mm (0~0.157 in)
Retightening ball joints of steering system	○						○							○	Check after every 300 hrs	
Wheel tightening bolts and nuts	○														Check daily	All should be tighten Front /Rear : 1600~1800 kgf.cm
Greasing each nipple		○	○	○	○	○	○	○	○	○	○	○	○	○	Replenish every 50 hrs (Everyday in dusty condition)	
Loose bolts and nuts	○															All should be tighten
Electric wiring	○						○							○	Check every year	All should work properly.

Inspection items	Daily	Inspection and servicing intervals Hour of operation (X10 on hour meter)												Intervals after that	Judgment criteria mm(in)
		5	1	1	2	2	3	3	4	4	5	5	6		
Electric apparatuses			0	5	0	5	0	5	0	5	0	5	0	Check every year	All should work properly
Adjusting accelerator pedal and throttle lever							★					★		Check after 300 hours	
Oil leaks in clutch housing							○						○	Check once a year with the lower plug pulled out	
Hydraulic fluid filter		●					★					●		Every 500 hours or 12months after first 50 hours	
4WD front axle housing oil		●		○		○	★	○		○		●		Check after every 100 hrs.Replace after every 500hrs	Replace if leaking
Rubber pipes		○		○		○		○		○			○	Check after every 100 hrs.	

- 1) Every terminal should be connected securely
- 2) Wiring should not interfere with other parts.
- 3) Fatigued wiring should be replaced.
- 4) Wiring should be held in each clamp properly.

Disassembly and reassembly of major components

SECTION 1. GENERAL PRECAUTIONS AND SEPARATION

AND REINSTALLATION----- 2-1

1. Before operation-----2-1

2. Precautions to be followed when installing standardized parts.

----- 2-1 **02**

SECTION 2. OPERATION CHART FOR DISASSEMBLY

AND REASSEMBLY BY MAJOR BLOCKS----- 2-4

SECTION 3. SEPARATION OF MAJOR COMPONENTS ----- 2-5

1. Separation of the front axle and axle bracket----- 2-5
2. Separation of the engine and front axle bracket----- 2-6
3. Separation of the engine and front transmission----- 2-7
4. Separation of the front transmission and Spacer transmission----- 2-12
5. Separation of the Spacer transmission and rear trans mission----- 2-17
6. Separation of the rear transmission and rear axle housing ----- 2-18
7. Separation of the rear transmission and Cylinder case ----- 2-19

Chapter 2. Disassembly and reassembly of major components

SECTION 1. GENERAL PRECAUTIONS FOR SEPARATION AND REINSTALLATION

1. BEFORE OPERATION

- 1) Always be safety-conscious in selecting clothes to wear and suitable tools to use.
- 2) Before disassembly, be sure that you familiarize yourself with the assembled condition for subsequence in reassembly.
- 3) Keep parts and tools in proper order during operations.
- 4) When servicing electrically charged parts, be sure to disconnect the negative battery terminal.
- 5) To prevent oil or water leaks, use the liquid gasket as required.
- 6) When lifting up only the front or rear part of the tractor, be sure to wedge the grounded wheels.
- 8) When the tractor is jacked up, be sure to support the entire tractor with something like a stand. Lifting it up with a jack only is dangerously unstable procedure.
- 9) When replacing parts, use authorized, genuine TYM parts only. TYM assumes no responsibility for accidents, operating problems or damage caused by the use of imitation parts.

Also, the use of unauthorized parts will result in relatively poor machine performance.

2. PRECAUTIONS TO BE FOLLOWED WHEN INSTALLING STANDARDIZED PARTS.

- (1) Roller or Ball bearings
 - 1) When a bearing is fitted in by the outer race, use an installer which is specially designed to push only the outer race and vice versa.
 - 2) The installer must be designed to install the bearing on the shaft in a parallel position.
 - 3) When installing a bearing which appears the same on both sides, install it so that the face which has the identification number faces in a direction for easy visual identification. All the bearings which are to be installed in the transmission case should be placed so that their identification number faces outward.
 - 4) If a shaft or hole where a bearing is to be installed has a stopper, the bearing should be pushed in completely until it is seated against the stopper.
 - 5) Installed bearings should turn smoothly.
- (2) Oil seals
 - 1) Oil seals installer should be designed so as not to deform the oil seals.
 - 2) During installation, be careful not to damage the lips, and assure that it is pushed in parallel to the shaft or hole.
 - 3) When oil seals are installed, there should be no turnover of the lips nor dislocation of the springs.
 - 4) When a multi-lip seal is installed, the grooves between lips should be filed with grease, not adhesive.

(3) O-rings

- 1) O-rings should be coated with grease before installing.
- 2) Installed O-rings should have no slack or twist.
- 3) Installed O-rings should maintain proper air tightness.

(4) Snap rings

- 1) Snap ring installers should be designed so as not to permanently deform the snap rings.
- 2) Installed snap rings should be seated securely in the groove.
- 3) Be careful not to overload the snap ring to the extent that it is permanently deformed.

4) How to install the snap ring:

When installing a snap ring, install it as shown in the figure with its round edge side turned toward the part to be retained. This round edge is formed when the snap ring is pressed out.

Fig.2-1

(5) Spring(roll) pins

- 1) Spring pins should be driven in properly as tightly.
- 2) Spring pins should be installed so that their seams should face the direction from which the load is applied.

Fig.2-2

- 3) The roll pins installed in the transmission or other parts where much force is applied should be retained with the wire.

(6) Cotter pins

When installed, cotter pins should be bent securely at the ends as shown in the figure

Fig.2-3

(7) Bolts and nuts

- 1) Special bolts are installed at several locations, so be sure not to interchange them other bolts.
- 2) Bolts and nuts should be tightened to their specified torque wrench.
- 3) When locking the bolts or nuts with wire or a lock washer, Be sure to wind the wire paying sufficient attention to its winding direction and bend the lock washer for secure locking.
- 4) When locking bolts and nuts with an adhesive, apply the adhesive on the thread and tighten securely.
- 5) Apply an adhesive(THREE BOND TB1104) to parts through which there is any possibility of oil leaks, such as stud bolts and tapped-through parts.
- 6) Each lock nut must be tightened securely.
- 7) When tightening bolts and nuts, refer to the tightening torque table.

(8) After installation, each grease fitting should be filled with grease.

- 1) When installing grease fittings of type B and C, be sure to turn the fitting tips in a direction that will provide easy access for a grease gun.

(9) Other precautions

- 1) Be sure not to damage any finished surfaces or parts.
- 2) Always refrain from forcing installation.
- 3) Each lever knob should be installed coated with an adhesive (SUPER THREE CEMENT TB1702)

- 4) Each contact surface should be coated with an adhesive (THREE BOND TB 1215) and tightened evenly with bolts. Adhesive coated surfaces should be installed within 30 minutes after application of the adhesive. The contact surfaces should be flawless and free from foreign matter, and especially from grease before application of the adhesive.
- 5) Precautions for applying adhesives.
The surface or the thread where and adhesive is to applied should be completely free of chips. The surface or the thread where an adhesive is to be applied should be completely free of oil-less.

Bolt Tightening Torque (kgf.m)						
Spec	4T		7T (8.8)		9T (10.9)

SECTION 2. OPERATION CHART FOR DISASSEMBLY AND REASSEMBLY BY MAJOR BLOCKS

SECTION 3. SEPARATION OF MAJOR COMPONENTS

1. SEPARATION OF THE FRONT AXLE ASSEMBLY AND THE AXLE BRACKET

Parts which can be inspected during this operation

-Final case -Differential gear -Power steering system

(1) Removal

- 1) Hold the front hitch or the front bracket securely with a crane or stands.
- 2) Support the front axle bracket with a jack
- 3) Remove steering hose(LH, RH) to the power cylinder or in the middle of the hoses.

Fig.2-4 Steering hose(RH, LH)

Note : When the pipes related to the hydraulic system are removed, their openings should be covered with plastic caps or the like to keep out dust or other foreign matter.

- 4) Remove four bolts connecting the front axle supports with the front axle bracket

Fig.2-5 Front axle

- 5) Remove the front axle assembly forward.

Note : When working on the 4WD version, the drive shaft should be removed ahead of time.

Fig.2-6 Drive shaft (4WD)

(2) Installation

- 1) Install the front axle assembly.
- 2) Install four bolts connecting the front axle supports with the front axle bracket

Note : Apply grease to the bushing and fill the oil seal with grease ahead of time. Install the oil seal carefully not to allow its lips to turn over.

- 3) Install both of the right and the left steering hose.
- 4) Install the drive shaft (4WD)

2. SEPARATION OF THE ENGINE AND THE FRONT AXLE BRACKET

Parts which can be inspected during this operation

- Air cleaner
- Radiator
- Engine front part.

(1) Removal

- 1) Hold or support the engine with a crane or stands.
- 2) Hold or support the front bracket or the axle bracket in a manner that the part other than the engine can be removed if required.
- 3) Open the engine hood.
- 4) Remove the side covers (RH and LH) and engine hood (Electrical wire Included)

Fig.2-7 Side cover (LH, RH)

- 5) Disconnect the negative and positive battery cables and other wirings.

Fig.2-8 Battery

- 6) Remove the ECU under the air cleaner assembly.
- 7) Remove the upper hose, lower hose and drain hose from the radiator.

Note : The radiator should be drained of the coolant ahead of time and remove the 4WD drive shaft.

- 8) Remove the two hoses for the power steering system or in the middle of the hoses.
- 9) Remove the inlet pipe of the air cleaner.
Remove the pipes for air conditioner.

Note : Refrigerant gas should be collected firstly.

Note : When the pipes related to the hydraulic system are removed, their openings should be covered with plastic caps or the like to keep out dust or other foreign matter.

Fig.2-9

- 10) Remove the axle bracket from the engine after removing the bolts.

Fig.2-10 Front axle bracket(LH, RH)

(2) Installation

Reassemble in reverse order of removal.

- 1) Install the axle bracket on the engine.
- 2) Tighten the bolts as to one of each to bilateral symmetry.

Fig.2-11

- 3) Connect the piping of the power steering system.
Install the drive shaft (4WD)
- 4) Connect the upper, lower and drain radiator hoses.
- 5) Install the inlet pipe of the air cleaner.
- 6) Connect the wirings and ECU and other electric wires.
- 7) Install the pipes of air conditioner.
- 8) Connect the ground strap and the battery cables.
- 9) Fill the radiator with coolant.
Charge the refrigerant gas to specified quantity.

3.SEPARATION OF THE ENGINE AND THE FRONT TRANSMISSION.

Parts which can be inspected during this operation

-Fly wheel	-Main clutch
------------	--------------

(1) Removal

- 1) Remove the front drive shaft (4WD).

Fig.2-12

- 2) Support the engine on the bottom with a jack or stands.
- 3) Hold the transmission with a garage jack or a crane so that the transmission side can be moved when needed.
- 4) Open the hood.
Remove both side covers (RH and LH).

Fig.2-13

- 5) Disconnect the battery cables, engine harness and the hood lamp wiring and other wiring harness.

Fig.2-14

5) Detach the fuel hoses for the drain and delivery hose.

Fig.2-15

6) Remove the three hoses for the power. Remove the hydraulic pipes.

Fig.2-16

7) Remove the coupler (Freezer hose) and heater hose.

Note : Refrigerant gas should be collected firstly.

Fig.2-17

8) Disconnect the rubber hose from the suction pipe.

Fig.2-18

9) Loosen the bolts in the red circle only.

Fig.2-19

9) Separate the engine from the transmission assembly after removing the bolts to the below description.

The point to be separated

Fig.2-20

10. Refer to the description in the parts catalogue

Fig. 501 Front Axle Support

Fig. 502 Front Drive Shaft

Fig. 701 Hood (1)

Fig. 715 Heater & Air-con

Fig.2-24

(2) Engine separation from the chassis.

When separating the engine from the chassis, the following steps are required as well as the ones mentioned above.

- 1) Lift the engine with the hoist and hold the front axle bracket with a stand or the like.
- 2) Disconnect the upper, Lower, and drain hoses from the radiator.
- 3) Disconnect the power steering system hoses.
- 4) Remove the fuel hose and the drain hose.
- 5) Disconnect the hydraulic line.
- 6) Separate the engine from the front transmission.
- 7) Wedge both sides of the front axle to prevent the engine from tilting.

Fig.2-28 Wedging

(3) INSTALLATION

REASSEMBLY IN REVERSE ORDER OF REMOVAL.

- 1) Install the engine on the front axle bracket.
- 2) Assemble the engine and the front transmission.

Note : Apply small amount of grease to each of the sliding parts. Be careful not to apply excessive amount of grease as this could cause clutch slipping. During operation, be sure to avoid any of the reassembly operations that may place load upon the input gear.

- 3) Install the quick coupler of the freezer
- 4) Install the power steering hose
- 5) Install the hydraulic system piping.
- 6) Connect the wiring for the engine.
- 7) Connect the other wirings
- 8) Install the accelerator wire
- 9) Connect the battery terminals.
- 10) Install the engine hood and side cover.

4. SEPARATION OF THE FRONT TRANSMISSION AND SPACER TRANSMISSION

Parts which can be inspected during This operation

- Reverse change gears
- Creep change gears
- Main change gears and related parts

(1) Removal

A : Removal of the cabin

- 1) Remove the side covers(LH and RH) after opening the engine hood.

Fig.2-29

- 2) Disconnect the battery cables and fuel line

Fig.2-30

Note : Disconnect the other wiring couplers.

- 3) Disconnect the reverse wire under the floor.

Fig.2-31 Reverse change

- 4) Disconnect the four pipes for the power steering hoses.

- 5) Disconnect the brake rods under the floor. Remove the front end loader valve after removing the hydraulic pipes.

Fig.2-33 Brake rod (LH, RH)/Loader valve

- 6) Disconnect the clutch rods in front of the floor located left side and remove the retaining pin.

Fig.2-34 Clutch rod

- 7) Remove the slow-return check valve knob.
- 8) Remove the diff-Lock pedal

Fig.2-35

- 9) Remove the main shift and transmission range shift levers. The levers can be separated in the middle.
- 10) Remove the control rods of the PTO shift and 4WD shift levers from the transmission.
- 11) Remove the position, draft control levers, External hyd. levers and Joy-stick levers.

Fig.2-36

Note : The best way to remove above levers is to loosen linkages under the floor.

Fig.2-37 Range shift lever (LH)

Fig.2-38

- 12) Remove the PTO solenoid wire. Disconnect the engine harness from main harness and other wirings.

Fig.2-39

13) Remove the coupler (Freezer hose) and heater hose.

Fig. 2-40

Note : Refrigerant gas should be collected firstly.

14) Remove four rubber mounts.

Fig.2-41 Rubber mounting

Note : Lift the cabin gradually taking care not to allow the shaft of the slow-return check valve and its hole in the floor to interfere with each other.

Note : Lift up the cabin gradually making sure that all relevant wiring. Piping, cock and links are disconnected.

15) Remove the Cabin assembly.

Fig. 2-42

Fig. 2-43 : 4 hangers to be lifted

B: Division of the chassis.

1) Drain the transmission case of oil

Transmission oil drain Plug
Fig.2-46

- 2) Wedge both sides of the front axle to prevent the engine from tilting.
 - 3) Remove the front wheel drive shaft.
 - 4) Hold or support the cabin with a crane or stands.
 - 5) Place a jack under the bottom of the front transmission case to support.
 - 6) Place a jack under the bottom of the mid or rear transmission case to support.
 - 7) Remove the reverse change metal, main shift and the sub shift levers.
- The levers can be separated in the middle
- 8) Remove the control rods of the PTO shift, and 4WD shift levers from the transmission.
 - 9) Remove the position, draft control levers, External hyd. levers and Joy-stick valve and hydraulic pipes.
 - 10) Remove the rear tire assembly.
 - 11) Remove the brake rods (LH, RH)

Fig.2-47 Brake rods

Fig.2-48 Brake rods

- 12) Remove the suction, delivery and drain pipes.
- 13) Remove the delivery pipe and the valve for the PTO clutch.
- 14) Remove the fuel tank and the fuel hoses.

Fig.2-49 Exterior of a transmission

15) Remove the reverse change lever and Hook comp

Fig.2-50 Reverse change lever and Hook

- 16) Remove the bolts which tighten the front transmission and spacer transmission cases.

Fig.2-51 The position of the bolts and the nuts

- 17) Move the rear part of the tractor rearwards by pushing the rear wheels by hand, and then the spacer and rear transmission assembly will be separated from the front transmission.

Note :When moving the rear part of the tractor. Be careful not to allow the garage jack to shift from the front transmission case.

Fig.2-52 The state under separation

Fig.2-53 The separated state

Remarks

The rear transmission and spacer transmission cases should be separated and the reverse shift lever removed in order to take out or provide access to the main shift and transmission range shift gears. For further details, refer to Chapter 5. Transmission.

(2) installation

Reassemble in reverse order of disassembly.

- 1) Assemble the front and spacer transmission.
(Tightening torque : 1,300~1,500 kg-cm)
- 2) Install the reverse shift lever along with reverse cable.
- 3) Install the delivery pipe and the valve for the PTO clutch.
- 4) Install the suction, delivery and drain pipes.

Tightening torque :
4,600~5,500kg-cm

Fig.2-54 PTO delivery pipe

- 5) Install the brake rods(LH, RH)
- 6) Install the front wheel drive shaft.
- 7) Install the fuel tank and the fuel hoses.
- 8) Connect the fuel gauge coupler on the fuel tank and the PTO valve switch.
- 9) Install the position , draft control levers, External hyd. levers and Joy-stick levers.
- 10) Install the control rods of the PTO shift, and 4WD shift levers from the transmission.
- 11) Install all levers, knobs and Rods.
- 12) Fix the floor at the four rubber mounts.
- 13) Install the tire assembly.
- 14) Fill the transmission case with oil :
35ℓ(9.24 US gal)

5. SEPARATION OF THE SPACER TRANSMISSION AND THE REAR TRANSMISSION

Parts which can be inspected during this operation			
-PTO clutch	-Speed range gear (Sub shift gear)	- Drive pinion gear	- 4WD drive gear

(1) Removal

- 1) Remove the cabin referring to "SECTION 3-4-(1) A ; Removal of the cabin"
When separating the spacer and rear transmission cases from each other, Remove the cabin referring to "SECTION 3-4-(1) A : Removal of the cabin"
- 2) Remove the rear transmission referring to SECTION 3-4-(1) B : Division of the chassis from 1) to 14)
- 3) Remove the 4WD shift metal, the main shift metal, and the sub shift metal.

Fig.2-56 4WD shift metal

Fig.2-57 Main shift metal Fig.2-58 Sub shift metal

- 4) Remove the bolts which tighten the spacer transmission and the rear transmission cases.

Upper : 2 x Nuts M14, Lower : 2 x Nuts M14
LH, RH : 6 x Bolts M14, Pin : 2 x D10-22

Fig.2-59 The position of the bolts and the nuts

- 5) Disengage the shifter link through the opening of the main change metal(support) and turn the crescent cut-away in the gear downwards.

Fig.2-60

- 6) Move the rear part of the tractor rearwards by pushing the rear wheels by hand.

Note :When moving the rear part of the tractor. Be careful not to allow the garage jack to shift from the front transmission case.

(2) Installation

Reassemble in reverse order of disassembly.

Note : The 4WD drive shaft should be installed on the rear transmission ahead of time.

1) Join the rear and spacer transmission cases.

Note : During the operation, be careful not to damage needle bearings, the cut-away part in the gear should be turned downward without fail so as to clear the gear to be positioned underneath.

2) Install the main change shifter link and each change metal.

3) Install the brake rods and front drive shaft.

4) Install the hydraulic piping.

5) Install two rear rubber mounts.

6) Install exterior parts.

7) Fill the transmission case with oil :
35ℓ(9.24 US gal)

6. SEPARATION OF THE REAR TRANSMISSION AND REAR AXLE HOUSING

Parts which can be inspected during This operation

-Brakes

-Final gears

(1) Removal

As both sides can be disassembled in the same way, only left-side will be explained here.

1) Drain the transmission case of oil

2) Lift up the rear transmission and remove the rear wheel on the diff-lock side.

Fig.2-61 Drain plug

3) Remove the tire assembly

4) Remove the brake rods.

5) Remove the 3-point linkage and related parts.

6) Support the Cabin mounting (floor panel) with a trestle or the like.

7) Remove the rubber mount along with the bracket.

Fig.2-62 Rear mounting

8) Remove the rear axle housing tightening bolts.

9) Detach the rear axle housing from the rear transmission case

Fig.2-63 Rear axle housing

(2) Installation

Reassemble in reverse order of disassembly.

1) join the rear axle and rear transmission

2) Reinstall the other removed parts.

3) Mount the rear wheel.

4) Refill the transmission with oil up to the specified level

-Level up to fill the oil can be sought from the rear axle housing(LH) of the rear transmission.

7. SEPARATION OF THE REAR RANSMISSION AND CYLINDER CASE

Parts which can be inspected during this operation

- Control valve
- Control linkage
- Piston and lift crank linkage
- PTO change gears.
- Differential gear

Inspection and service of the rear transmission should be performed following the instructions in the paragraph : **4. SEPARATION OF THE FRONT TRANSMISSION AND SPACER TRANSMISSION**

(1)Removal

- 1) Remove the the cabin referring to :
SECTION 3-4-(1)-11) A:Removal of the cabin”
- 2) When the tractor is equipped with an optional auxiliary valve, remove the slow-return shaft, the delivery pipe and the levers.
- 3) Remove the 3-point lift link and related parts from the lift arm.

Fig.2-65 Cylinder case assembly

- 4) Remove the Cylinder case tightening bolts.
- 5) Detach the cylinder case assembly from the rear transmission

(2) Installation

Reassemble the reverse order of disassemble.

- 1) Tighten the cylinder case on the rear transmission case to the specified torque.

Tightening torque	550~700 Kgf-cm (40.5~51.6 lb.fts)
-------------------	--------------------------------------

- 2) After reassembly, make sure that the system functions properly.

Chapter 3.Engine accessories

SECTION 1. RADIATOR

1.General description

The pressure cooling system includes mainly the radiator,water pump,multi-blade fan, and the thermostat.During the warm-up period,the thermostat remains closed and coolant is directed through by-pass to the suction side of the water pump.

Coolant then circulates through the cylinder block and water pump only to provide a uniform and fast warm-up period. Once the engine has reached operating temperature,the thermostat opens and coolant is pumped from the bottom of the radiator via the lower hose into the cylinder block. Here it circulates through the block and around the cylinders.

From the cylinder block,coolant is directed through the cylinder head and into the thermostat housing.With the thermostat open,coolant passes through the housing and upper radiator hose into the top of the radiator where it is circulated to dissipate heat.

Fig.3-1

Fig.3-2

2. Radiator

The radiator consists of radiator cores, a tank to Flow coolant,side plates to install the radiator, and a fan guide.

Fin-tube type cores are used and the cores and tank is made of anti corrosive Aluminum and Aluminum alloy.

3. SPECIFICATIONS

Description	T455/T555
Radiator core type	Wave Fin
Core train number	2 trains
Radiator fin pitch	3 mm
Thermal radiator area	18.0442m²
Pressure valve opening pressure	0.9 ±0.15Kgf/ cm²
Coolant capacity	9.3 ℓ
Test pressure	1.5 Kgf/cm²(21.3 psi)

4. REMOVAL OF THE RADIATOR

- 1) Release the clamp and remove the upper hose.
- 2) Release the clamp and remove the lower hose.
- 3) Release the hose clamp and remove the water drain hose.

Note:

- Refer to the paragraph”SEPARATION OF THE ENGINE AND THE FRONT AXLE BRACKET in chapter 2 for operation up to this step.
- When removing the radiator, take care not to damage the radiator cores and oil cooler.

5. INSPECTION OF EACH PART

- 1) Inspection for radiator water leaks.

Water leaks are liable to occur at the fitting portion between the upper tank and the core section or between the lower tank and the core section.

If any water leak should occur there,repair the leak by soldering.Besides making a visual check,a more complete inspection should be accomplished as follows:

- a. Leak test with compressed air.

Place the radiator as shown in the figure. Close the openings for water inlet and with something like a rubber plug and apply compressed air (1kgf/cm² or 14.2psi) through the drain pipe into the radiator.

Excessively compressed air may damage the cores, so perform the air delivery carefully,watching the pressure gauge. Water leaks are inspected by watching for rising air bubbles.

Fig.3-4

- b.Leak test with a radiator cap tester

With the inlet and outlet pipes plugged up and the radiator filled with water,replace radiator cap with a radiator cap tester as shown in the figure. Pump up the pressure in the radiator to the specified value and check to see if there are any leaks in the radiator.

When the radiator is water-tight,the pressure indicated on the pressure gauge does not increase,but if there are leaks,the pressure decreases.This tester is also applicable for leak tests for the whole cooling system,not only for the radiator.The test method is the same as mentioned above.

Fig.3-5

Testing Pressure	1.1 Kg /cm ²
------------------	-------------------------

2) Inspection for radiator clogging

To inspect the radiator cores to see if they are clogged with fur or rust, remove the radiator cap and check for transparency of the coolant, and for rust or fur formation around the radiator throat inside the radiator.

If some rust or fur has formed or the coolant transparency is very poor, the radiator should be cleaned.

a. Cleaning the radiator inside.

-Place the radiator upside down and supply pressurized water from a faucet to the lower tank, draining through the upper tank, as shown in the figure to wash out accumulated deposits.

Fig.3-6

-Clean with a detergent

When cleaning the radiator with a detergent, follow the instructions given by its manufacturer. Different detergents have different characteristics.

b. Cleaning the radiator exterior

- Cleaning the net (wire mesh)

After the tractor has been operated in dusty conditions, check the net daily and clean it if necessary.

-Cleaning the radiator cores

Clean the radiator cores by applying water spray or compressed air so as to for a right angle with the radiator cores, moving water application in parallel.

Note:

When cleaning the radiator cores with pressurized water, be sure to apply it at a right angle to the cores. Slanted application might deform their cooling fins.

3) Visual inspection of the exterior parts

When the radiator exterior is corroded, cracked, or badly damaged, replace the radiator. Also replace damaged or fatigued water hoses.

Retighten loose hose clamps securely if water is leaking through the hose clamps securely, or replace them if necessary.

4) Inspection of the radiator cap.

Check the radiator cap to see if it functions normally, using a radiator cap tester as following.

Fig.3-7

Pressure valve Opening pressure	0.9 Kg / cm² (12.80 psi)
Vacuum valve Opening pressure	0.04 ~ 0.05 Kg / cm ² (0.57 ~ 0.71psi)

-Function test:

The pressure type radiator cap has a pressure valve and a vacuum as shown in the figure.

Both valves are held against there seats by springs while the pressure in the cooling system remains within a specified range,thus keeping the cooling system air-tight.

When the pressure in the radiator rises higher than the specified valves,it overcomes the force of the pressure valve spring and open the pressure valve to release excess pressure through the overflow pipe as shown in the figure.

Fig.3-8

When the coolant temperature falls enough to cause the vapor to condense in the cooling system and decrease the coolant volume,the radiator pressure becomes negative.When this occurs,the vacuum valve opens to let outside air into the radiator as shown in the figure, thus preventing the radiator from being deformed.

Fig.3-9

6. RADIATOR REASSEMBLY

Reassemble the radiator in the reverse order of disassembly.

Note:

- The rubber hoses should be clamped securely and must not interfere with the cooling fan.
- The radiator cores must not interfere with the cooling fan.

7. DAILY INSPECTION

1) Coolant level inspection and coolant replacement

When the radiator is hot after operation,be sure to wait until the coolant cools down sufficiently before removing the radiator cap.

If this is not done,heated vapor might burst out and cause burns.Use fresh water from a faucet as the coolant. When the coolant is replenished or changed,let the engine idle for a while for the coolant to circulate sufficiently in the cooling system and replenish if necessary after stopping the engine.

2)Antifreeze

When The weather is cold,use an antifreeze to prevent the engine from freezing.The freezing point differs according to the mixture ration of water and antifreeze.Therefore,prepare an antifreeze solution which will have a freezing point 5°C lower than the estimated lowest atmospheric temperature in your environment.

Precaution for filling antifreeze.

- The radiator interior should be washed clean ahead of time.
- As concerns of mixing ratio of an antifreeze, follow its manufacture's instructions.
- Antifreeze should be blended well with water before filling.
- When the coolant level is lowered due to evaporation,maintain the level by adding water, not by using an antifreeze solution.
- When the coolant level is lowered due to leaks, maintain the level by adding an antifreeze solution of the same mixing ratio.
- As antifreeze corrodes point,take care not to spill it on painted parts.
- The tractor is filled with a permanent type antifreeze (Mobile Long Life Coolant) when shipping(mixing ratio:50%)

8. TROUBLE SHOOTING

TABLE 3-1

Problems	Causes	Countermeasures
1) Overheating	(1) Low coolant level	(1)Replenish coolant and inspect water leaks.
	(2) Fatigued pressure valve spring	(2)Replace radiator cap.
	(3) Loose or broken fan belt	(3)Adjust belt tension or replace.
	(4) Oily fan belt	(4)Replace.
	(5) Poor thermostat	(5)Replace.
	(6) Poor water pump or water leaks	(6)Repair or replace.
	(7) Clogged water passages	(7)Clean radiator and water passages.
	(8) Improper injection timing	(8) Adjust injection timing.
	(9) Clogged air ways	(9) Clean radiator exterior.
	(10) Fuel gas enters water jacket due to broken cylinder gasket	(10) Inspect cylinder head and replace cylinder gasket
2) Overcooling	(1) Poor thermostat	(1)Replace
	(2) Excessive low atmospheric temperature	(2) Decrease radiator working area by radiator masking.
3)Lose of coolant	(1) Leaking radiator	(1)Repair or replace
	(2) Loosely clamped or broken water hose	(2)Retighten or replace
	(3) Fatigued pressure valve spring	(3)Replace radiator cap
	(4) Leaking water pump	(4)Repair or replace
	(5) Water leakage through cylinder head gasket	(5) Inspect cylinder head and Replace gasket
	(6) Cracked cylinder head or body	(6)Replace
4) Noisy cooling fan	(1) Poor water pump bearing	(1)Replace
	(2) Loose or bent fan	(2)Retighten or replace
	(3) Unbalanced fan	(3)Replace.
	(4) Poor fan belt	(4)Replace.

SECTION 2. AIR CLEANING SYSTEM

1.GENERAL DESCRIPTION

Unfiltered air contains many particles harmful to the engine such as dust ,sand,or other foreign matter. When such foreign matter have entered in to the engine,They have mixed into the lubricant and promote wear of lubrication parts in addition to damaging the piston cylinders.To eliminate these harmful particles,an air cleaner has been installed.The air cleaner Which is installed on the T series tractor is a dry,cyclone type and is constructed as shown in the figure.

Under the influence of suction generated by the engine,unfiltered air flows through air inlet tube and is forced into a high-speed centrifugal motion.By this circulating action most of the dust and dirt particles are separated from the air and collected in the dust unloading valve(4).The remaining dust is removed as the air flows through the paper element(2) before being drawn into the engine.

① Body ② Paper element outer ③ Cover assy ④ Dust unloading valve

Fig.3-10

2.ELEMENT AIR CLEANER

(1) SPECIFICATIONS.

Model	T455/T555
Type	Dry, paper element filtering type
Rated intake air volume(m^3/min .(cu.ft/min)	4.25(150)
Air venting resistance (mmAq)	120 or less
Cyclone efficiency (%)	45 or over
Total filtering efficiency(%)	99.9 or over
Dust holding capacity (gr)	700
Filtering area (m^2)(sq.in)	$1.89\pm 4\%$
Filter material	FPG 068449
Temperature	$-30\sim 80^{\circ}\text{C}$

(2) DISASSEMBLY

1) Element removal

Remove the wing bolt which clamps the paper element and take out the element.

17. BOLT , HEX /SP
18. INDICATOR , REX770050 5KPa

Fig.3-11

3. INSPECTION OF EACH PART

- 1) Inspection of the cleaner body
- (1) Check the cleaner exterior for cracks, deformation, or damage and repair or replace if necessary.
- (2) Check each packing for fatigue or damage and replace if necessary.

Fig.3-12

- 2) Inspection of rubber hoses
- Check the rubber hoses for fatigue or damage and replace if necessary.
- 3) Inspection of the paper element
- To check the element for damage, Dry it sufficiently after washing and put an electric bulb in to the element and look for damage.

Fig.3-13 Element check

Note : Especially note the glue portions of the paper and metal parts.

4. CLEANING THE AIR CLEANER

Clean the air cleaner after 100 hours of operation or less depending on conditions in the following manner.

- 1) When the air cleaner is cleaned or the element is replaced ,dust accumulated inside the air cleaner body should be removed with a cloth. As inhaled dust causes engine wear, remove a dust accumulated inside the inlet pipe, the rubber hose which connects in the inlet pipe and the air cleaner, the inlet manifold and inlet port.
- (1)When accumulated dust is dry.
- When removing the dust in the element, hold the element by a hand and pat the side wall with other hand. Never hit the element against a stone or a concrete wall because that might cause its side wall to peel off.
- apply compressed air from inside of the element to blow dust off while turning the element by hand.

Fig.3-14 Element

Note : The compressed air to be applied should not have a pressure of more than 7kg/cm² (99.6psi) Maintain sufficient distance between the air gun and the element.

- (2)When accumulated dust is oily.
- Use a solution of TC 101 element detergent or the quality household neutral detergent. Leave the element in the solution for approximately 30 minutes and then wash it by dipping it in and out of the solution.

5.ELEMENT INSTALLATION

Install the element in the reverse order of disassembly, but follow these instructions.

- 1) Each tightening clamp must be secured and care must be taken not to miss the packing and washers.
- 2) Before installing the element, clean the rubber packing on the top of the element.

Note : The clamp retaining the element should be tightened sufficiently so that it will not become loose during operation.

SECTION 4. TROUBLESHOOTING	-----4-7

Chapter 4. clutch system

GENERAL DESCRIPTION.

The clutch is a device to engage and disengage the power of the engine. The construction of the clutch is as shown in the figure. It is composed of the flywheel which holds the clutch disc, the pressure plate, diaphragm springs, the clutch cover, and input gear.

The plate is held against the flywheel by the pressure springs and pushes the clutch disc against the flywheel. The clutch disc, which is sandwiched between the pressure plate and the flywheel, is mounted on the splined part of the input gear. It can move in an axial direction, but is locked in the rotational direction. It transmits engine power to the transmission by means of friction. Twelve coil springs are installed between the clutch cover and the pressure plate along the circumference, which are the pressure springs.

To disengage the engine power, the force of the diaphragm spring acting on the pressure plate must be eliminated. For this purpose the release lever is installed. By depressing the clutch pedal, the release lever pushes off the pressure plate from the clutch disc, thus providing clearance between the friction surfaces of the flywheel, the clutch disc, and the pressure plate. Thus the engine is disengaged.

Fig.4-1 Main clutch disc.

SECTION 2. SPECIFICATIONS

Table 4-1

Parts	Items		Description and assembly standard values
Clutch cover	Type		Diaphragm
	Springs	Free length mm (in)	43.3 (1.70)
		Stroke mm (in)	8.0 (0.31)
		Torque capacity (kgf.m)	Tc=40.1
		Clamping load (kgf)	P=650
Clutch disc.	Type		Dry single plate
	Facing material		Y02
	Outer dia. × inner dia. mm(in)		260X170 (10.23X6.69)
	Effective friction area cm ² (sq.in)		678.97(267.31) in both faces
	Main disc Spline hub	Outer dia. mm(in)	35.0 (1.378)
		Inner dia. mm(in)	31.7 (1.248)
		No.of splines	19
	PTO spline hub	Large dia. mm (in)	Ø25.0 (0.984)
		Small dia.mm (in)	Ø21.7 (0.854)
		No.of splines	13
	Disc thickness (free) mm (in)		8.3±0.3 (0.33)
	Disc thickness (press) mm (in)		7.8±0.3 (0.31) at 650 kgf
	Surface deviation mm (in)		0.4 (0.015) or less
	Lateral deviation mm(in)		1.0 (0.039) or less
	Vertical deviation mm (in)		1.0 (0.039) or less
Clutch pedal	Clearance between lever plate and release bearing mm (in)		2.0 (0.079)
	Clutch pedal free play mm (in)		30 ~ 40 (1.18 ~ 1.57)

SECTION 3. DISASSEMBLY, INSPECTION, AND REASSEMBLY

Fig. 4-3 Clutch assembly

1.MAIN CLUTCH

1-1.Disassembly

Separate the engine from the front transmission referring to the paragraph "SEPARATION OF MAJOR COMPONENT in chapter 2."

2) Remove the clutch assembly from the flywheel.

1.2. INSPECTION

(1) Inspection of the clutch disk

Check the clutch disk for wear or cracks on the facing, loose rivets, broken torsion springs, or wear of the hub splines.

1) Measure the suppression of the rivets, if the suppression is 0.2 mm or less and cracks or burnt damage are found on the surface, the disc must be replaced.

Rivet suppression	Usable limit
	0.2mm(0.008in)

Fig. 4-4

Note:
When removing the bolts, loosen them gradually in diagonal sequence.
Take care not to let oil get on the clutch facing.

Fig. 4-5

Note : Be sure to replace any clutch disc which has 0.2mm(0.008in) or less in rivet suppression. Use of a insufficient rivet depression disc will result in serious damage to the flywheel and the pressure plate.

- 2) Any oil stained clutch disc must be replace. However,a very small oil stain may simply be removed by use of a volatile solvent.

Note : The causes of oil stains must be located and necessary corrective measures must be taken.

- 3) Hardened lining surfaces must be repaired by use of a sandpaper,or be replaced with a new ones.
- 4) When loose rivets are found,replace the clutch disc assembly because those of rivets will loosen again even if they are retightened.
- 5) Install the disc on the input gear and inspect the rotational play. If the measurement deviates from the specified value, replace the disc.

Rotational play of the hub spline	Usable limit
	0.3mm(0.012in)

6) Measure the deviations of the clutch disc.If the measurements are beyond the usable limits, replace the clutch disc assembly.(Fig4-6)

	Usable limit
Surface deviation	0.5mm(0.019in) or less
Lateral deviation	1.1mm(0.043in) or less
Vertical deviation	1.0mm(0.039in) or less

Fig.4-6

- (4) Inspection of other parts.

Inspect the release levers,return springs,lever plates,clutch cover assembly, and lever bolts for wear,damage,and deformation,and replace parts which exhibit abnormalities.

1.3. REASSEMBLY

Reassemble them in reverse order of disassembly in accordance with the following instructions.

- 1) Be sure to keep oil off of the clutch disc,the pressure plate,and the flywheel.
- 2) Apply a thin coat of molybdenum disulfide-based grease to revolving or sliding parts prior to reassembly.

Note : Be sure not to apply too much grease because this will cause clutch slippage.

- 3) When installing the clutch disc on the flywheel,turn the longer protrusion of the hub towards the transmission. The reverse installation will damage the clutch cover or the disc.When installing the clutch assembly,use a special tool.

Fig.4-7

2.CLUTCH SHAFT AND RELATED PARTS.

(1) disassembly

- 1) Remove the tension spring and extract the sleeve.
- 2) Remove the wire which is retaining the taper pin.

- ①Bar set ②Release fork
 ③Taper pin ④Wire ⑤Grease fitting

Fig.4-8 Main clutch and related parts

- 3) Remove the grease fittings from the clutch shaft ends.
- 4) Turn the release fork upward and pull out the taper pin. Then draw the clutch shaft.

(2) Inspection

- 1) Inspection of release bearing
 The release bearing is of the grease-sealed type, but when the grease in the bearing reaches a low level or the bearing does not turn smoothly due to damage or seizure, replace the bearing.
Note : The release bearing should not be washed.
- 2) Inspection of sleeve.
 Ensure smooth movement of the sleeve. If it does not move smoothly, clean and grease it. Use heat-proof grease.
- 3) Inspection of tension springs.
 If there are some broken tension springs, replace them.
- 4) Inspection of the fork.
 Inspect the contact faces of the fork and the sleeve. If there is abnormal wear, make repairs or replace the fork or the sleeve.
- 5) Inspection of the clutch shaft.
 The clutch shaft must be revolve smoothly.

(3) Reassembly

Reassemble the disassembled parts in reverse order of disassembly in accordance with the following instructions.

- 1) Each sliding part should be coated with heat-proof grease.
- 2) The clutch fork taper pin should be locked securely with wire.
- 3) Smooth movement of each part should be conformed.
- 4) The release bearing must be installed in the correct direction.

Fig 4-9 Release bearing

Note : The splines of main clutch disc and PTO flange should be aligned by the special Jig. When it does not be prepared, those should be aligned by using the input shafts ahead of time.

Fig 4-10 Main clutch assembly

3. Final adjustment of the clutch pedal

Clutch pedal play

- 1) Loosen the lock nuts on the clutch rod and adjust the clutch rod length to achieve 30 ~ 40mm (1.18 ~ 1.57 in.) pedal play.

Retighten the lock nut securely.

Note : One lock nut has a right hand thread and the other has left-hand threads, so take care not to interchange them.

Fig 4-11 Main clutch pedal

Note : Adjust the clevis at the left in the front side of the cab.

- 2) Adjust the clearance between the safety switch and the bolt head to $10 \pm 0.5\text{mm}$ (0.254 in.) so that the switch will turn on only when the clutch is disengaged to allow the engine to start.

- 3) Inspect the clutch action.

- Inspection of clutch action and slippage.

While the engine is running, the transmission gears must be shifted smoothly with the brakes applied.

- Inspection of clutch slippage

While accelerating the engine gradually, the engine must stop when the clutch is engaged gradually with the parking brakes applied and the speed shift levers to 4X4.

4) Loosen the lock nut (30-03) on the clutch rod and adjust the clutch rod length to achieve 30mm (1.18 in.) pedal play. Retighten the lock nut securely.

Fig 4-11 Clutch adjustment

SECTION 4. TROUBLESHOOTING

1.PROBLEM :Clutch slippage.

The initial stage of clutch slippage is very hard to notice,but the following symptoms

- 1) The tractor is not generating adequate power when performing heavy duty operations.
- 2) Output is not commensurate to increate in engine speed when the engine is accelerated suddenly during operation.
- 3) Increased fuel consumption.

These symptoms are apt to be mistaken for engine problems. Clutch slippage that is not repaired will result in serious damage such as excessive wear of the clutch facing,the clutch cover, and even flywheel or clutch seizure.

TEST METHOD

If the parking brakes are applied and the transmission gears shifted to top speed and the engine stops,then the clutch is normal.But if the engine does not stop,it shows that the clutch is slipping.

Probable causes	Countermeasures
-No play in the release bearing	Adjust
-Broken or fatigued pressure spring	Replace
-Excessive wear of clutch facing	Replace
-Oil stained or hardened clutch facing	Repair or replace
-Deviation of flywheel or pressure plate	Repair or replace

2.PROBLEM :Poor disengage

When the clutch does not disengage properly,the transmission gears make noise when shifted,or shifting or the gears is difficult.

Probable causes	Countermeasures
-Worn or rusted splined section of the clutch disc hub	Remove rust or replace and apply grease
-Excessive deviation of the clutch disc	Replace
-Insufficient play of the release bearing	Adjust
-Excessive play of the release bearing	Adjust
-Dried pilot bearing	Replace

3. PROBLEM :juddering

Probable causes	Countermeasures
-Oil-stained clutch facing	Replace
-Fatigued pressure springs	Replace
-Hardened clutch facing	Replace
-Deviation in clutch facing	Repair or replace.
-Deviation or deflected wear of pressure plate or flywheel	Replace
-Difference in release lever heights	Adjust

4. PROBLEM: Abnormal noises

There are abnormal noises emanating from the clutch.

Probable causes	Countermeasures
-Broken or insufficiently lubricated release bearing	Replace
-Seized or worn pilot bearing	Replace
-Cracked disc plate	Replace

5. PROBLEM: Dashing or shifting

The tractor does not starting moving smoothly but dashes or is likely to stop when the clutch is operated during a operation.

Probable causes	Countermeasures
-Oil stained clutch facing	Replace
-Worn clutch facing or loose rivets	Replace
-Deviation or deflected wear of flywheel or pressure plate	Repair or replace
-Fatigued pressure spring	Replace

SECTION 4. TROUBLESHOOTING----- 5-47

1. Wheel drive system----- 5-47

2. PTO drive system----- 5-48

3. Power train diagrams----- 5-49

SECTION 1. GENERAL DESCRIPTION

1. WHEEL DRIVE SYSTEM

The wheel driving system is composed of the following major components:

Fig.5-1 Wheel drive system

1) The standard transmission produces **16** speeds forward and reverse : F1 and R1 by reverse change gears;; 4 speeds by main change gears; 4 speeds by sub-change gears.

2) Synchromesh transmission has 3rd and 4th speed stages of the main change gears synchronized.

Therefore, between these stages, gear shifting while traveling is possible (synchromesh version)

Note : 1st and 2nd speed stages of main change must be surely stopped traveling.

2. PTO DRIVE SYSTEM

1) The PTO drive system is composed of the independent PTO clutch and the PTO change gears.

2) The PTO change gears are housed behind the ring gear, which produce **1 PTO and 2 PTO** speed.

3. POWER TRAIN DIAGRAMS

Refer to page 5-49 and 50 at the end of this chapter

4. CONSTRUCTION AND FUNCTION OF THE SYNCHROMESH MECHANISM

1) Construction

- ① Spline Hub
- ② Spring(Synchro)
- ④ Key,synchro
- ⑤ Coupling,synchro
- ⑥ Inner, synchro /shuttle
- ⑦ In-Con,synchro/shuttle
- ⑧ Outer, synchro /shuttle

The synchromesh mechanism includes the components staged below

Fig.5-14 Synchromesh

Coupling Synchro

The synchro-hub is composed of ① Spline Hub

② Spring(Synchro) ④ Key,synchro

⑤ coupling ,synchro ⑥ Inner, synchro/shuttle

⑦ In-Con,synchro/shuttle ⑧ Outer, synchro/shuttle

Coupling Synchro(5) has a splined friction surface on its circumference. Key synchro (4) prevents coupling (5) from sliding until the torque, imposed upon the Key due to the speed differential caused when shifting gears, disappears. Thrust piece(6) is composed of an outer split pin and an inner and is held together as one unit by the expansion force of the key. It has a separated shape as shown in Fig.5-14

when the coupling is position to side and also serves as a lock Key to keep the synchro mechanism engage.

Spline Hub

It has a splined friction surface which forms a pair with coupling synchro(5). It meshes with the gears and through the splined part.

2) Function principles(operating procedures)

The synchromesh mechanism operates in the 2 stages mentioned below to complete the transmission from NEUTRAL to ENGAGEMENT

Neutral stage:

When force(F) is applied to neutral through the gear shift lever, coupling sleeve and synchro ring rotated with shaft following movement of the hub, other parts such as 1st Gear and 2nd gear rotated freely also move in the same direction by means of spread spring without allowing the hub to clear the groove in thrust piece until such time as the friction surface of synchro-ring comes into contact with the friction surface of synchro-cup

Fig. 5-16 Neutral stage

Engage stage:

At the moment when both the friction surfaces come into contact, the ring turns by as much as the surplus space in hub for block pin as shown in Fig.5-5

Fig. 5-17 Engage stage

1.1 DISASSEMBLY

(1)Removal of Bolts and related parts separate the engine from the front transmission referring to the paragraph 3 of SECTION 4. SEPARATION OF MAJOR COMPONENT in Chapter 2.

- a. Remove the Bolts in the front transmission
- b. Separation of the front transmission and the spacer transmission.

Note : Be careful not to damage the seal ring of the sleeve.

- c. Separation of the reverse metal from the spacer transmission
- d. Pull out the Reverse change assembly.
(Refer to the next page)
- e. Pull out spring pin from input shaft.
- f. Remove the snap ring C
- g. Pull out Reverse change gears and Main shift gears

Fig.5-21 Reverse change gears and Main shift gears

(2) Removal of the PTO clutch assembly

Separate the hydraulic cylinder case from the rear transmission referring to the paragraph 7 of SECTION 3. SEPARATION OF MAJOR COMPONENT in Chapter 2.

- a. Remove of the hydraulic cylinder assembly
- b. Remove of the cover 1 in the spacer
- c. Remove of all parts around the shaft 1 and the shaft 2.
- d. Pull out the snap ring next to the PTO clutch assembly.
- e. Push the shaft 3 rearwards with holding the PTO clutch assembly with the other hand.

Fig.5-23

Note : Be careful not to damage the seal ring of the PTO clutch assembly
When the PTO clutch assembly is trouble-free, keep it aside, without disassembling it, in a Clean, dust- free place

Fig.5-24 PTO and the lever

Note : Be careful not to damage the seal ring of the PTO clutch assembly. When the PTO clutch assembly is trouble-free, keep it aside, without disassembling it, in a Clean, dust-free place.

Fig.5-25 PTO change gears

(3) Disassembly of reverse shaft and related parts.

- a. Pull out the snap ring(13)to the gear(14)
- b. Remove the bearing(36 and 33)
- c. Remove the washers(15 and 22), needle bearings(17 and 20), synchro- hub comp,(35), etc. synchro-cup(34) can be taken off as an assembly with gears(16 and 21).
- d. Remove the snap ring(37) and detach the synchro- cup.

1.2 INSPECTION

Before and after disassembly, inspect each part for points mentioned below, and replace if necessary.

Inspection items	Standard values	Usable limits
Backlash of each gear (measured in meshed condition)	0.1 - 0.2 mm (0.004-0.008 in)	0.3 mm (0.011 in)
Stepped wear of teeth	0 mm (0 in)	0.3 mm (0.012 in)
Assembled width of synchromesh assembly Dimension A	54 mm (53.75~54.10) (2.126 in)	-
Synchro-hub thrust for shifting Neutral-Engaging	13.0-18.8 Kgf (28.7-41.5 lbs)	9.5 Kgf (20.9lbs)

- Inspect bearings such as ball bearings and needle bearings for abnormalities in rotation such as irregularity, hitching, etc. by turning them with pressure applied by hand. Replace defective ones.
- Seriously worn or damaged parts should also be placed.

1.3 REASSEMBLY

(1) Sub Assembly of reverse shaft and related parts.

Fig.5-26

- a. Install Double Synchro-Assy(7) on gear Helical 29T (12) and gear spur 20T(5) respectively
- b. Double Synchro-Assy(7) and above sub- assemblies on shaft input Drive(13)

Note : As each synchromesh assembly maintains a specified installed width, be sure not to mix different pairs of the synchro-hub comp, and the synchro-cup

- c. Install washers and install the bearings positively.

Note : As these washers have their own directions of installation, be strict to install them correctly.

- (2) installation of each sub-assembled shaft.
 a. Refer to the description for all parts around the front tr

Fig.5-27

- b. Installation of the main change gears and the reverse gears.
 Install each sub-assembled shift into the reverse metal.

Fig.5-28 Reverse change gears

Fig.5-29 Main change gears

e. Sub-assembly of the sleeve metal with the release bearing and the drive shaft

- | | | | | |
|---------------|----------------|-------------|---------------------|------------------------|
| 1.Bar set | 2.Release fork | 3.Taper pin | 4.Wire | 5 .Grease fitting |
| 21.Hub,sleeve | 22.Bolt Hex | 27.Sleeve | 28. Bearing release | 29. Spring, Tension 31 |

Fig.5-30

(3) installation of the reverse change lever and related parts.

- Reassemble in reverse order of disassembly, following the next instructions.
- a. Install the reverse gear assembly from the spacer transmission referring to the description (Fig 5-27), (Fig.5-28), (Fig.5-291)
 - b. Oil seals should be installed in their correct direction., be careful not to interchange these seals.
 - c. Apply grease to the O-ring and the oil seal, the needle bearing to prevent its damage.

2. PTO CLUTCH

2-1. DISASSEMBLY

Note : When installing the PTO clutch assembly, apply a thin coat of grease to the seal rings and install it taking care not to damage these rings.

Note : Disassembly of the PTO clutch assembly should be done in a clean, dust-free place. Exercise special attention to avoid damage of the seal rings, etc

- a. Pull out PTO drive shaft rearwards.
- b. Pull out PTO drive gear forwards.
- c. Remove snap ring (D95 for hole), and take back-up plate, disc assembly, and driving plates.
- d. While holding return spring compressed with a special tool, remove snap ring

- e. Disassemble into separate parts; piston, return spring, brake disc, and cover assembly.

2.2 INSPECTION

- a. Cover assembly
 - Replace a cover assembly which has a damaged or worn sliding surface.
 - If there is any damage to the cover assembly and the piston seal ring, these parts should also be replaced.
- b. Disc assembly
 - If the thickness of a disc assembly exceeds the usable limit mentioned below or combined width of the disc assembly and driven plate is less than 28.8mm(1.13) in), replace both the disc assembly and driven plate.

Fig.5-33

-Inspection for disc thickness and serration wear.

Inspection Items	Specified values	Usable limit
Disc thickness	$2.6 \pm 0.1\text{mm}$ (0.102 in) (7pcs)	2.4mm (0.094 in)
Surface flatness	-	0.2mm (0.008 in)

Fig.5-34

c. Driven plate

- Inspection for deformation and burning.
- A seriously damaged or worn disc should be replaced.

Inspection Items	Specified values	Usable limit
Plate thickness	$1.6 \pm 0.05\text{ mm}$ (6pcs)	1.5mm (0.059 in)
Surface flatness	-	0.15mm (0.006 in)

d. Brake disc

- Inspection for deformation and burning.
- A seriously damaged or worn disc should be replaced.

Inspection Items	Specified values	Usable limit
Disc thickness	$3 \pm 0.1\text{mm}$ (0.118 in)	2.7 mm (0.11 in)
Surface flatness	-	0.2mm (0.007 in)

Fig.5-35

- e. If the combined thickness of the return plate and brake disc deviates from the specified value, replace both parts.

Inspection Items	Specified values	Usable limit
Combined thickness of return plate and brake disc	$5.5 \pm 0.16\text{mm}$ (0.217 in)	5.1mm (0.2 in)

Fig.5-36

- f. Also inspect other parts for wear and deformation and replace them if necessary

Note : Seal ring and the two seal rings should be replaced as a pair

2.3 REASSEMBLY

Reassemble the parts in reverse order of disassembly, following these instructions.

Note:

- Each parts should be washed clean before reassembly.
- Apply multi-purpose, quality grease to needle bearings in advance.
- Each bolt and nut should be tightened to the respective specified torque table.
- Every time a gear is installed, its smooth rotation should be checked.
- Every snap ring should be seated securely in its groove.

- When installing seal rings, apply fresh oil ahead of time and install them carefully so as not to damage them.
- Install the return plate with the press-processed side turn towards the brake disc.

Fig.5-37

- ① Return plate ② Brake Disc

- When installing the return spring, use a special tool; the snap ring should be securely seated in the groove.
- When pushing the RBB's (6205 and 6005) into the gear, be careful only to push their outer races.

- Install the snap ring in correct direction.
- After reassembly, check to see that gear turns smoothly by locking the PTO clutch

- ① PTO clutch assembly
② Ball bearing(6005)
③ PTO hub

Fig.5-38

Note : Be careful not to damage the seal ring of the PTO clutch assembly. When the PTO clutch assembly is trouble-free, keep it aside, without disassembling it, in a Clean, dust-free place.

3. MAIN CHANGE, SUB-CHANGE, AND 4WD CHANGE GEARS.

(1)Synchronmesh transmission version.

Fig.5-39 Synchronmesh transmission version

Fig.5-39 Reverse change gears, Main change gear and related parts.

3.1 DISASSEMBLY

Fig.5-40

Separation the spacer transmission case and rear transmission case from each other referring paragraph 3 in SECTION 4.SEPARATION OF MAJOR COMPONENTS in chapter 2.

With this operation, the transmission is divided into the front transmission and the spacer transmission. The front transmission includes the main speed shift, and the spacer transmission includes sub-speed shifting and 4WD shifting mechanisms.

Note : The separation of the gears mentioned in the figure is possible without dividing the spacer transmission and the rear transmission from each other

(1) Disassembly of main change gears(main speed shift), part of sub-change gears(speed range shift) and shifters.

Fig.5-41

a. Set the cut away part of the gear so that it clears the gear as shown in Fig.5-42

Fig.5-42

b. Remove the reverse cable and pin.

c. Pull out the reverse Hook, main speed shift gears, and shifters rearwards by tapping it with a plastic hammer.

Note : Take care not to allow the gear to drop as it is free when the above assembly is removed.

d. Remove the shift stays from the shift metal and remove the gears assemblies as shown Fig.5-43.

d. Remove bearings and gears from each shaft.

Note : Make sure that the turning lock of the PTO clutch is securely seated in the groove in the Rear transmission case.

Fig.5-43.

(2) Disassembly of the sub-change gears
(Speed range shift)

- a. Remove the sub-shifter and shifter stay.
- b. Pull out the PTO shaft , 4WD shaft and gear

- c. Remove the snap ring from the end of the pinion gear shaft
- d. Remove the hub
- e. Remove the sub-change gears.

3.2 INSPECTION

Before and after disassembly,inspect each part for points mentioned below,and replace if necessary.

Inspection Item	Standard Value	Usable limits
Backlash of each gear(measured in meshed condition)	0.1-0.2mm(0.004-0.008in)	0.5mm (0.020 in)
Stepped wear of teeth	0mm	0.3 mm (0.012 in)
Synchro-hub thrust for shifting Neutral →Engaging	14 ±0.5 Kgf (30 lbs)	9.5 Kgf (20.9 lbs)
Thrust play of fixed gears	0 mm	0.5 mm (0.020 in)
Wear in each shifter		0.5 mm (0.020 in)

- Inspect bearings such as ball bearings and needle bearings for abnormalities in rotation such as irregularity, hitching, etc. by turning them with pressure applied by hand.Replace defective ones.
- Serious worn or damaged parts should also be replaced.

3.3 REASSEMBLY

Reassemble the parts in reverse order of disassembly, following these instructions.

Note:

- Each part should be washed clean before reassembly.
- Apply multi-purpose,quality grease to needle bearings in advance.
- Each bolt and nuts should be tightened to the respective specified torque in accordance with the tightening torque table.
- Every time a gear installed, its smooth rotation should be checked.
- Every snap ring should be seated securely in its groove.
- As each synchromesh assembly maintains a specified width,be sure not to mix different pairs of the synchro-hub comp. and the synchro-cup.
- Remember to install the snap rings.

(1) Installation of main change gears

- While holding the gear in the position shown in the drawing, install the assembly of the main change gears and related parts in position by tapping it slightly on the front of a plastic hammer and then the gears by tapping it on the rear.
- Sub assemble the shifter stay, spring, and steel ball (Fig.5-44) on the reverse change lever and install the sub-assembly on the shift stay
- Align the holding parts in the reverse change lever with RBB's of the sub assemblies of the counter gears and main change gears, straight pins, etc., and install the reverse change lever on the spacer transmission case.

Note :

- Align the cut-away part of gear to clear the gear
- When installing the O-ring, take care not to damage it or allow it to fall

Fig.5-48

Spring pins should be retained with wire and each wire should be twisted in the position illustrated

Spring pin ends should be driven in until their ends become flush with the shifter surfaces

Fig.5-49

Note :

- Install spring(roll) pins so that their seams are positioned as illustrated in Fig.5-49

**(2) Reassembly of sub-change gears
(speed range shift)**

-Reassemble the parts in reverse order
of disassembly following next precautions.

- a. Never forget to install needle roller bearing and collar.
- b. Pay attention to the installed direction of gear

Fig.5-51

c. Be sure to install the sub-change shifter

4. Rear transmission case

Fig.5-53. 2 speed PTO version

3-1. DISASSEMBLY

Separate the spacer transmission and the rear transmission from each other and then remove the hydraulic cylinder case. referring to paragraph 5 of SECTION 4. SEPARATION OF MAJOR COMPONENTS in Chapter 2.

(1) Ring gear, Drive pinion, and related parts.

Fig.5-54

- | | | |
|-------------------------|----------------------------|---------------------------|
| 1. Diff case | 13. Metal diff case LH | 28. Pinion LH Helical 11T |
| 2. Spring pin | 15. Shim B (t=0.2) | 29. Pinion RH Helical 11T |
| 3. Washer spring | 16. Bolt 17 Bearing ball | 30. Bearing Ball |
| 4. Bolt Hex fine | 18 Shim A (t=0.1) | 32. C-ring |
| 5. Pin ,spring | 19. Gear set 10-41T | 34. Sleeve |
| 6. Pinion Diff | 20. Shim 0.1 | 35. Bearing Ball |
| 7. Collar pinion | 21. shim 1.0 | 37 C-ring |
| 9. Pinion bevel 16T LH | 22. Nut, M40 P1.5 | 39 Shaft, Diff Lock |
| 10. Washer ,thrust | 23. Bearing taper roller | 43. Fork Diff lock |
| 11. shaft diff pinion | 24. Shim 0.2 | 46. Pedal Diff lock |
| 12. Pinion bevel 16T RH | 26. Collar, thrust 45X68X4 | |

a. Remove the diff-lock parts.

1.Pedal comp.Diff lock 2. Spring,Diff lock pedal
3. Fork Diff lock 4.Shaft,Diff lock

Fig. 5-55

- b. Dismount the diff-case (RH) and the snap ring (LH) by installing push bolt as shown in Fig.5-55
c. The number of installed shims should be written down or memorized for later reference.

1.Shim A 2.Shim B 3.Metal Diff case LH
4.Bolt

Fig. 5-56

- d. Remove ring gear as a set.
e. When disassembling the ring gear set further, remove bearing with a puller.

- f. Remove the bolts, and the ring gear can then be separated from dif-cases
g. Pull out the diff pinion shaft and take out the dif-pinions and dif-side gears.

1.Diff-pinion shaft 2,3.Spring pin 4.Sleeve comp.

Fig.5-57

Note :

When assemble the spring pin, be sure the spring pin should be different direction (Ø5 and Ø8)

- h. Remove the pinion metal tightening bolts and take put drive pinion and related parts as an assembly.
i. Release the lock of nut and remove the nut

Fig.5-58

- j. Push out drive pinion from drive pinion metal on a press.
k. Remove the bearing from the drive pinion with a special tool.

(2) PTO shaft and related parts(2 speed PTO version).

Fig.5-59

PTO Shift

- | | | | |
|----------------------|----------------------|----------------------|---------------------|
| 1.Gear helical 12-20 | 13. Gear helical 58T | 2. Lever comp,Bar 12 | 30.Stay shifter PTO |
| 16.Gear helical 50T | 18.Shaft output PTO | 34.Fork shifter 1 | 37.Arm comp |

- a. Remove the rear hitch to the top link
- b. Remove the change arm(28)
- c. Remove the PTO shifter stay(1) rearwards and take out the PTO shifter(4)
- d. Be alert to the steel ball which may spring out of the shifter.
- e. Pull out the snap ring and related parts rearwards.
- f. Remove the PTO shaft, the gears and related parts.

Fig.5-60 Top view of rear transmission

4.2. INSPECTION

Before and after disassembly, inspect each part for the items mentioned below. Parts which deviate from the specified values should be replaced.

-Wash clean all disassembled parts and check them for wear, damage, deformation, Burning , etc. Defective parts should be corrected or replaced.

-As the drive pinion and the ring gear make a pair, they should be replaced together even if only one is found to be defective.

-Backlash between the drive pinion and the ring gear

Backlash	0.1-0.25 mm (0.004-0.009 in)
----------	---------------------------------

-Backlash between the diff-pinion and the dif-side gear.

Backlash	0.13-0.2 mm (0.003-0.008 in)
----------	---------------------------------

-When the backlash exceeds 0.5mm, also inspect the thrust collar for wear, defective collars should be replaced.

-Disengaging the resistance of PTO shifters.

Standard Value	18-22 Kgf (40-49lbs)
Usable limit	17 Kgf (38 lbs)

* Measured at the shifter

4.3. REASSEMBLY

Reassemble the parts in reverse order of disassembly, following these instructions.

(1) Ring gear, Drive pinion, and related parts.

a. Apply oil to the drive pinion and related parts ahead of time. Then install them and tighten the assembly to the specified torque.

Tightening torque (M40x1.5pitch)	1.4 Kgf.m (9.36 ft.lbs)
-------------------------------------	-------------------------

- (1) Drive pinion
- (2) Tapered roller bearing
- (3) Drive pinion metal
- (4) Tapered roller bearing
- (5) Nut (M40X1.5)

b.Be sure that the starting torque of the drive pinion meets the specified level.

Starting torque	0.11-0.13 Kgf.m (0.792-0.936ft.lbs)
-----------------	--

c. After the starting torque has been adjusted to the specified level, crimp the lock of the nut at one point as illustrated.

d. Tighten the drive pinion metal by providing it with the same shimming thickness that it had when it was disassembled.

When the drive pinion or the ring gear has been replaced, the proper number of shims to be installed should be determined based upon the following procedure:

Drive pinion metal tightening torque	5.5-7 Kgf.m (39.8-69 ft.lbs)
--------------------------------------	---------------------------------

Fig.5-63

e. Install the differential gears.

Fig.5-64 diff gear comp.

Ring gear tightening torque(M10x1.25-25)	5.5-7 Kgf.m (34.5 ~ 43.9 ft.lbs) Apply lock-tight
--	---

Note:

- As shown in Fig5-64, there are two kinds of differential side gears. Although are case hardened, the one installed on the side of the diff-lock is treated further and colored black. Take care not to mix them when assembling.
 - Apply multi-purpose, quality grease to the parts mentioned below: (Three bond-1901)
 - Tooth surfaces of diff-pinions and dif-side gears
 - Friction surfaces of diff-pinion shafts and diff-pinions.
- f. The Backlash between diff-pinion and dif-side gear should be within as range of 0.1 to 0.25mm (0.004-0.009 in) and these parts should turn smoothly.

- 15.Shim(B) 18.Shim(A) 20.Shim(0.1)
21.Shim(1.0) 24.Shim(0.2)

g. Install the differential gear assembly.

Diff-case metal tightening torque. (M10x1.5-30)	5.5-7 Kgf.m (39.8-69 ft.lbs)
--	---------------------------------

Note : When reassembling the used pinion and ring gear, reinstall the same thickness of shims as was installed before disassembly in each shimming position.

h. Backlash adjustment between the drive pinion and the ring pair (Fig5-65)

- i. As the drive pinion and the ring gear make a pair, be sure not to mate them with other parts from differential tractors.
- ii. Adjust the shimming to backlash of 0.1-0.25 mm (0.004-0.009 in).
The standard shimming is 0.5mm (0.016 in) on both sides.

Adjust the shimming to backlash

Fig.5-66

Note : Strike the circumference of the ring gear both sides with a copper hammer by turning the ring gear manually, and check to see that the backlash remains unchanged. The backlash should be checked at four points 90 degrees apart to each other.

iii. inspection of the tooth bearing

Apply an even coat of oil-dissolved minium on the drive pinion teeth and turn the drive pinion on the ring gear to check the tooth bearing by observing the bearing traces on the ring gear.

Correct Contact 	When drive pinion and ring gear are meshed correctly with each other and their backlash is within specified range, contact is in middle of ring gear tooth and is approximately 75% of total tooth width.
Tip contact 	Excessive backlash. Move differential case and shims from right side to left side. See "Assembly and installation".
Root contact 	Inadequate backlash. Move differential case shims from left side to right side. See "Assembly and installation".
Toe contact 	Too little engagement. Remove some drive pinion support shims. See Transmission: REAR TRANSMISSION ASSEMBLY-Setting cone center.
Heel contact 	Too much engagement. Add some drive pinion support shims. See TRANSMISSION: "REAR TRANSMISSION ASSEMBLY-Setting cone center."

INSTALLATION OF A NEW PAIR OR RING GEAR AND DRIVE PINION

- 1. use a new pair of ring gear and drive pinion delivered from the manufacturer. Never mix its components with those of other pairs.

Note : Every ring gear-dive pinion pair is adjusted and inspected for tooth contact individually at factory.

- 2. Adjust the backlash between the ring gear and drive pinion to be 0.1-0.25mm(0.004-0.009 in) by shimming the drive pinion metal and right and left dif-case metal and make sure that their tooth contact is proper

(2) PTO shaft and related parts(2 speed PTO version).

- a.Pushing the PTO counter gear end into the bearing until the stop on the gear is securely seated against the bearing.The seal should be coated with an adhesive (THREE BOND TB1215) on the circumference before installing.
- b.Install the oil seal on the PTO shaft,paying attention to its installed direction.
- c.After installation,the slide coupling should smoothly slide and mesh with the designated gears.

5. SHIFTERS AND RELATED PARTS.

5.1. CONSTRUCTION

(1)Forward and reverse control linkage mechanism(Linear speed shifter)
(synchromesh transmission version)

Fig.5-69

- | | | | | |
|------------------------|-------------|-------------------------|-------------------|---------------|
| 1.Hook comp, reverse | 2.Arm comp | 3.Pin,taper split | 4. Plate | 5.Bolt |

(2) Main change mechanism(Main speed shift)
(Synchromesh transmission version)

Fig.5-70

Fig.5-71

Note : The bolt tightening the bottom of the metal should be coated with an adhesive ahead of time

(3) Range shifter (Speed range shift) mechanism

Fig.5-74

Note:
The bottom two tightening bolts should be with an adhesive on their threads before be tightened.

Fig.5-75

Take care not to install the boot slanted

Apply adhesive
(Three Bond TB1215)

Apply adhesive

(4) Front drive change (4 WD shaft) mechanism

(5) Rear PTO shift mechanism(2 speed)

1.Gear helical 12-20 13. Gear helical 58T
16.Gear helical 50T 18.Shaft output PTO

2. Lever comp,Bar 12 30.Stay shifter PTO
34.Fork shifter 1 37.Arm comp

Fig.5-79 PTO speed version

Note :

- Pay attention to the installed direction of the metal
- Apply lock tight
- Apply three bond (TB1215)
- Pay attention to the installed direction of the oil seal

Fig.5-80 PTO 2 speed version

b. Rear PTO shaft(2 speed version)

Fig.5-82.Rear PTO shaft

Note : The snap ring C should be securely seated in the groove and the press-processed side turned towards the outer side.

When installing the O-ring to the PTO sleeve and the oil seal, take care not to damage it or allow to fall.

c. Rear PTO shift stay

Fig.5-83.Rear PTO shift stay and related parts

(8) Drive pinion Sub assembly

- 1.Pinion Bevel 2. Metal Pinion 3. Bearing taper ,Roller 4.Nut(M40,P1.5) 5. Gear (S-S 35-28)
6. Washer(30X46X3) 7. Gear spur 16-39 8. Hub (30X62X19)

Note:

- a.Apply oil to the drive pinion and related parts ahead of time. Then install them and tighten the assembly to the specified torque.
- b.Be sure that the starting torque of the drive pinion meets the specified level.
Starting torque is 0.11-0.13 Kgf.m (0.792-0.936ft.lbs)
- c.After the starting torque has been adjusted to the specified level, crimp the lock of the nut at one point as illustrated.
- d. Be sure that these parts should turn smoothly

When the drive pinion or the ring gear has been replaced, the proper number of shims to be installed should be determined based upon the following procedure :

- 1.Pinion Bevel 2. Metal Pinion
3. Bearing taper ,Roller 4. Nut(M40,P1.5)

Fig.5-85

(9) Differential gears.

(Fig5-86)

- | | | | |
|--------------------------|--------------------|---------------------------|---------------------------|
| 1.Diff case | 6.Pinion Diff | 9.Pinion bevel 16T LH | 11.shaft diff pinion |
| 12 Pinion bevel 16T RH | | 13.Metal diff case LH | 17 Bearing ball |
| 19.Gear set 10-41T | | 22.Nut,M40p1.5 | 23.Bearing taper roller |
| 26.Collar,thrust 45X68X4 | | 28. Pinion LH Helical 11T | 29. Pinion RH Helical 11T |
| 30. Bearing Ball | 34.Sleeve | 35. Bearing Ball | 37 C-ring |
| 39 Shaft,Diff Lock | 43. Fork Diff lock | | 46.Pedal Diff lock |

Note:

- 1.When assembling without replacing the pinion gear and ring gear with new ones, provide the same shimming thickness as that provided before disassembly.
- 2.Backlash between diff-pinion and diff-side gear should be within as range of 0.1 to 0.2mm (0.004-0.008 in) and these parts should turn smoothly.
- 3.When reassembling the used pinion and ring gear, reinstall the same thickness of shims as was installed before disassembly in each shimming position.
- 4.Backlash adjustment between the drive pinion and the ring pair(Fig5- 66) As the drive pinion and the ring gear make a pair, be sure not to mate them with other parts from differential tractors.
- 5.Adjust the shimming to backlash of 0.1-0.25 mm (0.004-0.009 in)

5-2 PRECAUTIONS FOR DISASSEMBLY, INSPECTION, AND ASSEMBLY

(1) Disassembly

When drawing a shifter stay from its shifter, be careful not to lose the steel ball. It can jump out of the shifter.

(2) Inspection

-Shifter –disengaging load:

Main change and sub change : **18-22 Kgf (40-49lbs)**

4WD change, Creep change : **25-29 kgf (55-64 lbs)**

-Usable limit of shifter-disengaging load:

Main change & Sub-change : **17 Kgf (38lbs)**

4WD change, Creep change : **24Kgf(53lbs)**

-Wearing limit of each shifter: **0.5 mm (0.02 in)**

(3) Reassembly

a.lubricate the grooves in the shifters.

b.Each shifter should be installed in the correct direction.

c.When installing the shifter on the shifter stay, Use the special tool as shown in Fig.5-87

Fig.5-87

SECTION 4. TROUBLESHOOTING

1. WHEEL DRIVE SYSTEM

Problems	Causes	Countermeasures
Transmission makes noise in neutral	Insufficient or improper lubricant	Replenish or replace
	Excessive splines of change shaft,spline hub,etc	Replace
	Worn or broken bearings	Replace
	Slide couplings interfering with the gears due to worn or deformed shifters	Replace
Gears make a noise when shifted.	Improperly disengaged clutch	Repair or replace (Clutch pedal play)
	Wear in width of gears,splined hubs,collars,etc	Replace
	Defective Change shift fork	Replace
Gears disengage by themselves	Broken shifter springs	Replace
	Wear in width of gears,splined hubs,collars,etc	Replace
	Worn shifters	Replace
Gears do not engage or disengage	Improper disengaged shift lever	Repair or replace
	Gears are locked due to foreign matter between them	Remove the foreign matter

2. PTO DRIVE SYSTEM

problem	Causes	Counter measures
PTO does not spin with PTO shifted to ON	PTO shift lever is in neutral	Shift lever positively to ON
	Defective PTO switch	replace
	Clogged PTO valve	Wash clean
	Poor Pump	Replace
	Defective solenoid valve	Replace
PTO spins but does not produce sufficient torque.	Worn clutch disc	Replace
	Broken or fatigues seal ring at clutch sleeve	Replace
	Loose joint or broken O-ring of delivery valve	Retighten or replace
	Poor pump	Replace
	Clogged PTO valve	Wash clean
PTO does not stop when PTO switch is shifted to OFF	Defective PTO valve solenoid	Replace
	Poor PTO valve (contamination)	Wash clean
	Broken clutch piston return spring	Replace
	Poor switch	Replace
PTO follows too much when PTO switch is shifted to OFF	Improper oil	Replace
	Insufficient warming up	Let tractor warm up sufficiently
	Poor PTO clutch brake	Replace
	Weak or broken piston return spring	Replace
	Poor PTO valve(contamination)	Wash clean
	Deflected clutch plate	Replace

Chapter 6 Front axle(4WD)

1. GENERAL DESCRIPTION

The 4WD front axle is a center pivot type. The front wheel drive mechanism is incorporated as a part of the axle.

The front wheel drive power is taken off the rear transmission and transmitted to the differential in the front axle where the power is divided into right and left and to the respective final cases. In the final cases, the transmitted revolution is reduced by the bevel gears to drive the front wheel. The 4WD mechanism with bevel gears provides wider steering angle and greater durability.

Fig 6-1

SECTION 2. SPECIFICATIONS

		T455/T555
Wheel alignment	Toe-in (mm)	2 ~ 6 mm
	Camber	3°
	Caster	1°
Front axle	Pivot metal (F) bore (mm)	Φ55
	Pivot metal (R) bore (mm)	Φ80
	Pivot metal (F) bush (mm)	50X55X20
	Pivot metal (R) bush (mm)	75X80X30
	Housing (F) Diameter (mm)	Φ50
	Housing (R) Diameter (mm)	Φ75
	Front wheel steering angles(RH)	52 °
	Front wheel steering angles(LH)	52°
	Swing angles (LH, RH)	7°

69.Shim set B

1.1.DISASSEMBLY

- 1) Dismount the front wheel drive shaft, referring to the pertinent paragraph in chapter 2.
- 2) Remove the right and left Hydraulic hose.
- 3) Suspend the front axle bracket with a chain.
- 4) Remove the front metal and rear metal clamping bolts. The front axle can then be separated from the axle bracket.
- 5) Remove the front and rear pivot metals.

1.2.INSPECTION

1) FRONT AXLE SHAFT DIAMETER

Measure the diameter at a roll bush contact point with a micro-meter or vernier calipers. If the measured value is less than usable limit, replace the housing front axle or bush in Metal pivot (F) or Metal pivot (R) .

	Front	rear
Standard value as assembled	Ø50	Ø75
Usable limit	Ø49.9	Ø74.9

Fig.6-5

Fig.6-4

2) FRONT AXLE BUSH BORE DIAMETER

Measure the bore diameter of the roll bush in the pivot metal(F). If the measured value exceeds the usable limit, replace the bush.

	Front	rear
Standard value as assembled	Ø50	Ø75
Usable limit	Ø50.35	Ø75.35

Fig.6-6

1.3 REASSEMBLY

Reassemble the parts in reverse order of disassembly, following these instructions.

- 1) Lips of the oil seals, bush contact surfaces, and O-rings should be coated with grease in advance.
- 2) When installing the roll bushes, abide by the following precautions.

- Use an installer and press in the bush on a press.
- The bore surface should be coated with grease in advance.
- The shim of the roll bush should reach position as shown Fig.6-7. In other words the seam should be in a position which is free from any load.

Fig.6-7

Note:

Slanted or forced installation of the bush should be avoided, and the bore surface of the bush should not be damaged.

- 3) Pay particular attention to the installed direction of thrust collar, that is, with the sharply-edged face turned towards the bevel gear case.
- 4) When the thrust collar has been replaced or the fore-and aft play of the front axle exceeds the usable limit, correct play by screwing in the adjust bolt on the top of the pivot metal (F).

Fig.6-8

Note:

After correcting the pivot metal play, tighten the lock nut of the adjusting bolt to a torque of 11.7~13.7KN-m (12~14 kg-m)

- 5) The reassembled front axle should rock smoothly while pivoting.
- 6) When the tie-rod is reinstalled, the toe-in should be adjusted. At the same time, the steering angles of the both wheels should also be adjusted.
- 7) Be sure the dimension C and D is same size and Adjust E and F as same dimension.

Tightening torque(M20x1.5p) : 24~26kg.m

Fig.6-9

| 25.Pinion,Diff(12) | 32.Pin spring | 47.Bearing,Taper Roller | |

2.1 DISASSEMBLY

- 1) As concerns operation prior to removal of the front axle, refer to the paragraph covering disassembly of the center pivot
- 2) Remove both wheels
- 3) Remove the drain plug from the final case and drain oil from the final case.
- 4) remove both final case assembly (A and B) from the front axle(Fig.6-11)

Fig.6-11

- 5) Remove the oil seal, assuring parallelism of the ring gear and bearing

Fig.6-12

Note:

The number of shims(1) installed and the the shimming thickness should be noted for later reference.

- 6) Remove the bearings from the Axle housing And the ring gear, and then the ring gear can be separated from the Axle housing.
- 7) Remove the straight pin which retains the axle housing.

Note: Discard the removed straight pin and oil seal and install a new pin and Oil seal when reassembled, because this pin and oil seal is apt to be damaged when removed.

- 8) Remove the snap ring and the bevel pinion can then be removed together with the TRB's (Fig.6-11)
- 9) When separating the TRB's from the bevel pinion, release the calking of the lock nut and remove the bearings.

Fig.6-13

Note:

The lock nut should be calked at a point completely apart from the threads may damage the threads of the bevel pinion.

2.2 INSPECTION

- 1) visually check the bearing surfaces of the bevel pinion and ring gear teeth.

Note:

The bevel pinion and the ring gear should be replaced as a pair.

- 2) seriously worn or damaged parts should be replaced.

2-3.REASSEMBLY

Reassembly the parts in reverse order of disassembly, following these instructions.

- 1)Each friction surface should be coated with grease in advance.
- 2)The bevel pinion and the ring gear make a distinct pair after a mesh adjustment performed at the factory. Consequently, when reassembling the pair, be sure to pair parts with a same reference number.

-Tighten the lock nut to the specified starting torque of the single unit of the bevel pinion.

Note: Fig.6-14
As a general rule, a disassembled lock nut should be replaced and a new one should be installed. However, when there is no alternative but to reuse the disassembled lock nut assure that it can lock securely.

Note:
Measure the starting torque a manner as shown in the figure 6-14.

Specified starting torque	11 -13 Kgf-cm
---------------------------	---------------

-When any of the bevel pinion, ring gear, TRB, collar, etc. has been replaced, inspect the bevel pinion assembly for thrust play in the front axle housing.

Specified thrust play mm(in)	0.13-0.2 (0.005-0.0078 in)
---------------------------------	-------------------------------

Note:
TRB and collar should be replaced as a pair.

(1) Bevel pinion (8)

Fig.6-15

(2) FRONT DIFF CASE

- a. When installing washer and thrust washer, apply fresh Molybdenum grease ahead of time.
- b. Apply fresh Molybdenum grease to teeth of diff-pinion and diff-side gear.
- c. Each parts should be washed clean, and There should be no sharp edge to the surface of thrust washer.
- d. When assemble the spring pin, Be sure the spring pin should be different direction (Ø5 and Ø3)
- e. When any of the bevel pinion, ring gear, TRB, collar, etc. has been replaced, inspect the bevel pinion assembly for thrust play in the front axle housing.

Specified thrust play mm(in)	0.13-0.2 (0.005-0.0078 in)
---------------------------------	-------------------------------

3) DIF CASE AND BEVEL PINION

Fig.6-16

Fig.6-17

- 1) Each friction surface should be coated with grease in advance.
- 2) The bevel pinion and the ring gear make a distinct pair after a mesh adjustment performed at the factory. Consequently, when reassembling the pair, be sure to pair parts with a same reference number.
- 3) When installing the TRB's from the bevel pinion, Be sure the calking of the lock nut and the bearings.
- 4) Install the snap ring and the bevel pinion can then be installed together with the TRB's (Fig.6-17)

- Note:** Discard the removed straight pin and oil seal and install a new pin and Oil seal when reassembled, because this pin and oil seal is apt to be damaged when removed.
- 5) Install the bearings from the Axle housing And the ring gear, and then the ring gear can be assembled from the Axle housing.
 - 6) Install the straight pin(4) which retains the axle housing.
 - 7) When any of the bevel pinion, ring gear, TRB, collar, etc. has been replaced, inspect the bevel pinion assembly for thrust play in the front axle housing through drain plug hole.

Specified thrust play mm(in)	0.13-0.2 (0.005-0.008 in)
---------------------------------	------------------------------

3. FINAL CASE

3-1. Front gear case 1,2

Fig.6-18

- | | | | |
|--------------------------|--------------------------|---------------------|-------------------|
| 1. Case, Final Drive (A) | 11. Case, LH Final Drive | 20. O-ring | 40. C-ring |

| 3. Bearing Ball/HL1 | 15. Seal | 25. Shaft, 528 | 42. C-ring |
| 4. Pin Parallel | 16. Bearing Ball | 26. Shaft, 344 | 43. Plug, square |
| 5. Bolt | 17. Shaft | 30. C-ring | 45. Shim 75X90X2 |
| 6. Washer spring | 18. Gear, Bevel 11T | 31. Collar, 68X80X2 | 46. C-ring |
| 7. Gear, Bevel 16 | 19. Bearing, Ball | 36. O-ring | 49. Nut |
| 8. Bearing, ball | | | |

3-2. Front gear case 3.

3.1 Disassembly

- 1) Drain oil from the final case by removing the drain plug.
- 2) Remove the tie rod or the tie rod end.
- 3) Remove the final drive case clamping bolts and take out the assembly of the wheel shaft,
- 4) Remove the wheel shaft cover clamping bolts and cap (100)

Note:
Discard the removed Cap(100) and install a new cap(100) when reassembled,because this cap is apt to be damaged when removed.

- 5) Detach the snap ring C from the bevel gear.
- 6) Extract the wheel shaft bearing together with the bevel gear,using a bearing puller

Fig.6-21

- 7) Remove the stop ring and the wheel shaft can be extracted.

Fig.6-22

- 8) Remove the seal from the wheel shaft cover

Fig.6-23

- 9) Remove the cap (23) from the bottom of the final case B and detach the snap ring(hole). Then the counter shaft(17) and RBB can be removed.

Note:

The removed cap(90) (black plug) should be discarded and replaced when reassembled.

3.2 INSPECTION

- 1) Wheel shaft cover

- Inspect mechanical oil seal,O-rings, Gears, cases,etc. and replace them if worn or damaged.
- Measure the diameter the part which makes contact with the wheel shaft,with a micro-meter or vernier-calipers.When the measured value less than the usable limit,replace the wheel shaft cover.

Standard value	62
Usable limit	61.9

Fig.6-24

- 2) Final Drive case (B)

- Measure the diameter the part which makes contact with the Final drive case (A),with a micro-meter or vernier-calipers.When the measured value less than the usable limit, replace the wheel shaft cover.

Standard value	110
Usable limit	110.1

Fig.6-25

3.3 REASSEMBLY

Reassemble the parts in reverse order of disassembly, following these instructions.

- 1) Apply an adhesive (THREE BOND TB1215) to the following parts.
 - a.Contact surfaces between the final case B and wheel shaft cover.
 - b.Contact surfaces between the final case A and front axle.
- 2) The installed wheel shaft should turn smoothly.
- 3) When installing unitized seals on the wheel shaft cover and the rotating part between the final cases (A and B),apply force only to the outer circumference of the seal as shown in Fig.6-26 to avoid deformation.

Fig.6-26

- 4) The oil seal should be coated with grease in advance.Then install them carefully,assuring that their lips are not turned over.
- 5) The reassembled final case (B) should turn smoothly until it makes contact the stopper.
- 6) When the wheel(tire) is reinstalled,turn it by hand to make sure that all the mechanism turns smoothly without making any noise.
- 7) After adjustment of the toe-in,perform road tests.There should be no abnormalities such as vibration,abnormal noises,defected steering wheel operation,etc.

-Wheel shaft cover

- 1) Every snap ring(6) should be seated securely in its groove.
- 2) Be sure the numbers of Bevel gear is correct

Fig.6-27

-Final drive case A

- 1) Each parts should be washed clean before reassembly.
- 2) Apply multi-purpose,quality grease to bearings in advance
- 3) Every time a gear and bearings are installed, its smooth rotation should be checked
- 4) Adjust Back lash between bevel gear (38T) and bevel gear (11T) with collar(35) .

Back lash mm(in)	0.1-0.2 (0.003-0.008 in)
---------------------	-----------------------------

- 5) Apply oil to the housing ahead of time to install the mechanical seal.
- 6) Be sure that the length of shaft.
- 7) Tighten the bolts to the specified torque.

Tightening torque	550-700Kgf.cm
-------------------	---------------

- 8) Adjust backlash between gear bevel and gear bevel (2) with collar

Back lash mm(in)	0.1-0.2 (0.003-0.008 in)
---------------------	-----------------------------

- 9) Apply an adhesive to the Cap (90),and be sure not to deform when installing.

Note: Refer to Fig.6-23

- FINAL DRIVE CASE AND HOUSING

Fig.6-28

- 1) When installing the shaft,Be sure that the gears are not damaged.
- 2) Be sure the differences between the LH and RH shaft.

	LH	RH
Specified length	528mm	344mm

Fig.6-29

- 3) Tighten the bolts to specified torque.

Tightening torque	1300-1500 Kgf.cm
-------------------	------------------

- STEERING CYLINDER

Fig.6-30

- 1) When installing the steering cylinder,Be sure that the rods are not damaged.
- 2) Install the pin(21) before assembling the cylinder.
- 3) Apply an adhesive Locktite and tighten the bolts to specified torque

Tightening torque	900-1100 Kgf.cm
-------------------	-----------------

- 4) Apply an adhesive locktite to the ball joint (7) and tighten the ball joint to specified torque

Tightening torque	2400-2600 Kgf.cm
-------------------	------------------

- 5) Be sure to bend the split pin (5) after installing the ball joint

SECTION 4. TROUBLE SHOOTING

PROBLEMS AND PROBABLE CAUSES	COUNTERMEASURES
● Steering wheel hard to turn	
1)Too low tire inflation 2)Broken thrust bearing 3)Stuck or broken ball joint of tire-rod end 4)Seizure or poor lubrication of axle end bush	Inflate to specified value Replace Grease or replace Grease or replace
● Vibrating or pulling steering wheel	
1)Unbalanced wheels 2)Wheel deflation 3)Unequal diameter of both tires 4)Loose,worn,or damaged wheel axle bearing 5)Loose,worn,or damaged wheel steering wheel shaft 6)Worn final case bush 7)Loose final case-front axle tightening bolt 8)Loose front wheel(tire)tightening nuts1)	Adjust balance Repair or replace Adjust inflation or replace Repair or replace Retighten or replace Replace Retighten Retighten
● Steering wheel tends to turn to the right or left while traveling on straight paved road.	
1) Deflected wear of tire 2) Different tire diameters 3) Damaged final case bearing	Replace Adjust inflation or replace Replace
● Excessive or eccentric wear of tire	
1)Improper tire inflation 2)Worn front wheel shaft bearing 3)Poorly adjusted toe-in 4)Front wheel drive is always engaged	Adjust Replace Readjust correctly:0~5mm (0.08-0.24 in) Engage FWD only when required
● Noise	
1)Loose fasteners 2)Worn or damaged final case bearing 3)Worn bush 4)Wear or poor movement of tie-rod end 5)Excessive backlash of differential and bevel gear	Tighten correctly to specified torque Replace Replace Lubricate or replace Adjust
● Different steering angles in both directions	
1)Lengths of RH and LH tie-rods are different	Adjust

SECTION 4.TROUBLE SHOOTING-----7-7

Chapter 7. Rear axle and brakes

1. GENERAL DESCRIPTION

The rear axle system is of the central axle type, which contains the final reduction gears, differential gears with diff-lock, and brakes. The power from the engine is transmitted to the right and left wheel pinions through the differential gears, and reduced in the revolution to the rear wheels by the wheel gears. A wet, multi-Disc, mechanical operated brake system is employed. Each of the brakes has 5 friction plates and can produce significant braking force with excellent durability. The two actuators work to push their friction plates in opposite directions, that is, outward, so that stable braking force can be realized in both forward and reverse movements of the tractor. A dif-lock mechanism which is housed in the right-hand rear axle housing is employed to lock the differential gears and is activated by depressing the diff-lock pedal, resulting in the same rotary speeds of both wheels.

Fig.7-1

SECTION 2. SPECIFICATIONS

MODEL		T455		T555
Final reduction gears		Type	Helical gears	←
		Reduction ratio	4.9	←
Brake system	Friction Plate	Type	Wet, multi-disc, Mechanically operated	←
		diameter	Φ140(Φ5.5in)xΦ180mm(Φ7.0 in)	←
		Thickness	3.4±0.1 mm(0.134 in)	←
		Lining material	Paper base	←
		Number of plates	4 on each side	5 on each side
	Separator Plate	Outer diameter	Φ188mm(Φ7.4 in)	←
		Thickness	2.5±0.09 mm(0.098 in)	←
		Number of plates	3 on each side	4 on each side
		Metal brake assembly Installed thickness	34.9 ±0.1 mm(1.374 in)	29 ±0.1mm (1.142 in)
		Total brake thickness	42.2mm(1.661in.)	54mm(2.126in.)

SECTION 3.DISASSEMBLY,INSPECTION,AND REASSEMBLY

Separate the rear axle housing from the rear transmission referring to **paragraph 6 of SECTION 3**.

SEPARATION OF MAJOR BLOCKS in Chapter 2

1) REAR AXLE HOUSING AND BRAKE SYSTEM

1.1 Disassembly

- 1) Remove the brake cover tightening bolts and remove the disc brake assembly on it.
- 2)The actuator can be disassembled by removing Spring
- 3) Detach the brake arm and the cam from the brake cover (Fig.7-2)
- 4) Pull out the snap ring from the brake housing.
- 5) Remove the pinion gear.
- 6) Extract the bearing with a puller and Release the lock of Nut.
- 7) Remove the wheel gear
- 8) Remove the wheel shaft with a hammer
- 9) Be careful to keep the mechanical seal and the taper roller bearing

Note : Removed the Oil seal should be replaced with a new one when reassembled
Be careful to keep the friction surfaces of the linings, Actuators and separator plates free from damage and foreign matter.

1.2. INSPECTION

- 1) **Friction plates.**
Replace the plates whose surfaces have been become glossy by carbonization or whose thickness exceeds the usable limit.

Fig.7-4

Standard thickness:mm(in)	3.4±0.1(0.134)
Usable limit:mm (in)	3.0 (0.118)

Fig.7-3

Note : Also replace those whose grooves have been worn out completely even if only on one side

2) Actuator (Reference)

Check the ball, spring, pressure plate, and brake rod for abnormality. Replace defective parts. Replace the actuator whose thickness exceeds the usable limit.

Fig. 7-5

Standard thickness :mm	14.9±0.1
Usable limit: mm	14

Note:
Slight scratches on the friction surface can be corrected with sandpaper(#1000)

3) Separator plate.

Measure the thickness and replace the plate whose thickness exceeds the usable limit or whose surfaces are damaged (Fig.7-6)

Fig. 7-6

Standard thickness:mm(in)	2.5±0.09 (0.098)
Usable limit:mm (in)	2.2(0.087)

4) Wheel shaft

Check the shaft for abnormalities like wear, damage, etc, and replace a defective one.

5) Bearings

Check them for abnormalities like hitching, irregularity, etc. in rotation after being washed clean. Replace defective ones.

6) Oil seals

Removed oil seal should be replaced with a new one when reassembled.

1.3 REASSEMBLY.

Reassemble the parts in reverse order of disassembly, follow these precautions.

- 1) Make sure that oil grooves, friction surfaces, etc of the brakes are free from matter such as dust, iron powder, etc. to avoid brake lining damage.
- 2) When installing the brake unit on the wheel pinion, friction plates and separator plates should be arranged in correct order and never forget to retain the unit with the snap ring.
- 3) Metal Brake cover tightening bolts should be tightened to the specified torque with a torque wrench. (Fig.7-7)

Fig. 7-7

Tightening torque	5.5-7 Kgf.m (39.8-50.6ft-lbs)
-------------------	----------------------------------

- 4) Replace the mechanical seal.
Install the taper roller bearing into the axle housing, and the mechanical seal by the special tool as shown in the figure(Fig.7-8)
- 5) Install the wheel gear and bearing on the wheel shaft and retain them with nut.
- 6) Apply adhesive (THREE BOND 1215) to the contact surfaces of the brake cover and the housing and then retain the plates by tightening the nuts to the specified torque or the specified dimension.

Fig.7-8

Tightening torque	9-11 Kgf.m (65-79.5ft-lbs)
Dimension	9.4±0.1

SECTION 4. TROUBLESHOOTING

Problem	Causes	countermeasures
1) Rear axle		
Noises	· Worn or damaged bearing · Worn gear or wheel shaft	Replace Replace
2) Brake system		
(1)Insufficient braking force	· Insufficient depressing of brake pedals · Improper pedal free play · Worn friction plates	Depress pedals positively Adjust Replace
(2)Brake noise	· Insufficient brake oil · Broken actuator spring · Eccentric wear of actuator	Replenish Replace Replace
(3)Brake overheating	· Insufficient oil · Excessive pedal free play · Improper operation	Replenish Adjust Operate brakes properly
(4)Brake cannot be disengaged completely.	· Improper brake pedal free play · Broken actuator spring · Broken pedal spring	Adjust Replace Replace
(5)Not uniform braking	· Improper free play adjustment · Worn actuator ball	Adjust Replace
(6)Excessive pedal play	· Improper adjustment of brake rod · Worn actuator-fork tightening bolt · Worn brake shaft or brake arm	Adjust Replace Replace

Chapter 8. Power assisted steering system.

SECTION 1. GENERAL DESCRIPTION

The hydraulics of this power-assisted steering system are actuated by a specially designed steering valve system.

Non Load reaction valve blocks the L,R cylinder ports in neutral condition and does not transmits the reaction load of the tire to the steering wheel in neutral. Generally the system is used for the vehicles that treat heavy equipment or low speed traveling.

Hydraulic circuit consists of Independent system.

The oil from tank flows into gear pump of orbitrol via filter, and the quantity of oil in the proportion to the rotations of steering wheel flows into steering Cylinder Via "R"-port at right turn and via "L"-port at left turn. As follow figure shows components composition of power steering system on the vehicle with the Orbitrol

Fig.8-1

SECTION 2. SPECIFICATIONS

1) POWER STEERING GEAR PUMP

MODEL		T455/T555	
Delivery (cc/rev)		7.2 cc/rev (18.3ℓ/min)	
Pump performance	150 (kgf/cm²)	1000 rpm	6.2LPM
		1800 rpm	11.9LPM
		2600 rpm	17.5 LPM
Maximum pressure (kgf/cm²)		210 kgf/cm²	
Rated operation speed (rpm)		500~3000 rpm	
Rotation direction		C.W as viewed from shaft end	

2) Power steering valve Unit(orbitrol)

MODEL	T455/T555
Model number	1452-405-400-1B
Displacement (cc/rev)	69
Rated flow (ℓ/min)	16
Maximum system pressure (kgf/cm ²)	130 (12.7 Mpa)
Max. back pressure (kgf/cm ²)	25 (2.45 MPa)
Max. temperature(°C)	95
Input torque (Kgf.m)	0.1~0.2 kgf.m
Main relief pressure setting (kgf/cm ²)	130 kgf/cm ² (at 16ℓ/min)
Recommended filtration (ISO4406)	10 μm Nominal
Weight (kgf)	5.5 (12.12lb)

3) OIL TANK

MODEL	T455/T555
TANK	Transmission Case
Fluid volume (ℓ)	35ℓ (9.24 US gal)
Fluid	THF500

SECTION 3. FUNCTION

1.Open Center Non Load Reaction

1.Neutral Position

When the steering control valve is in the neutral position, inlet flow(P) from the priority valve moves the flow selector spool against its spring. This flow is blocked at the control valve control spool. The signal port is connected to the reservoir(T) through orifices in the control spool. The priority valve will only supply enough oil to the control valve to compensate for internal leakage and maintain low stand-by pressure. The oil at each side of the steering cylinder is connected to each side of the metering pump, this allows a degree of self centering when turning out of a bend.

Fig.8-2 Neutral position

2) Right Turn

When the steering control valve shaft is rotated to the right, the control valve moves off center. This connects the inlet port (P) to one port of each metering pump section and also connects the other port of each metering pump section to the cylinder. The amount that the spool moves off center depends on how fast the steering wheel is rotated and also how much effort is required to turn the wheel.

Fig.8-3 Right turn position

Fig. 8-4 Left turn position

3) Left turn

When the steering control valve shaft is rotated to the left, the control valve spool moves off center. This connects the inlet port (P) to the one port of each metering pump section and also connects the other port of each metering pump section to the cylinder. The amount that the spool shifts off center depends on how fast the steering wheel is turned and how much effort is required to turn the wheel.

4) Manual steering

When there is no piston pump supply pressure the flow selector is moved to the left by its spring. This connects together the inlet and outlet ports of the lower gyrotor pump and disconnects this pump from the system. When the steering is operated manually, only the upper gyrotor pump section is used to direct flow to the steering cylinder. This reduces operator effort to an acceptable level, however the number of turns from lock to lock is increased.

Fig. 8-5 Manual steering

SECTION 4. Disassembly,Inspection,And Reassembly

1. Major component of steering valve (Orbitrol)

2.SPECIAL TOOLS

A.Holding tool, code no. SJ150L9001-01

B .Assembly tool for shaft seal ø17.5,
code no. code no. SJ150L4011 - 01

C. Assembly tool for shaft seal ø19,2,
code no. SJ150L4012 - 01

D .Assembly tool for dust seal ring,
code no. SJ150L0396 -01

E. Pliers for piston in pressure relief valve,
code no. SJ150-9000 -25

F. Fork for fitting cardan shaft (OMM)
SJ 151G9000 -1

G .Ordinary hand tools.

Socket spanner (5/8 in)

Ratchet spanner, 1/2”

Torque wrench: 0-70 Nm (0-7 da Nm)

Allen keys: 5 & 8 mm a/flats

Small screwdriver, ground sharp.

Pincers

3. Disassembly

Separate the orbitrol referring to Fig.8-2 of
SECTION .Disassembly,Inspection,And
Reassembly 1.Major component of steering
valve (orbitrol)

STEP 1.

- Column

If there is a steering column on OSPM, place the
unit in the holding tool, on the **four locating
pins** with steering column upwards. Dismantle
the steering column.

STEP 2.

-Pressure relief valve (30, 31)

If there is a pressure relief valve in OSPM,
remove the plastic plug from the adjusting screw
and unscrew with the 5 mm a/flats Allen key.
Remove the spring and use special pliers-lift the
valve cone out of the housing.

Lift OPSM clear of the holding tool, turn it so
that the output shaft points downwards and place
it in the holding tool again.

Note, the locating pin in the tool must engage
with the OSPM housing.

STEP 3.

-Special. Screws (22, 23)

Remove the screws with a 16 mm a/flats (5/8") spanner.

-End cover (19)

Remove end cover sideways.

STEP 4.

-Gear wheel set (17, 18)

Hold a hand under the gearwheel set to keep the gearwheel from falling out.

Remove O-rings.

STEP 5.

-Distributor plate (16)

Remove distributor plate.

-Cardan shaft (13)

Remove cardan shaft.

STEP 6.

-O-ring (15)

Remove O-ring from housing.

-Balls and ball stop (3, 4, 37)

Shake out check valve ball (not in all units), ball stop and emergency steering ball. Use pincers if necessary.

STEP 7.

Place the OSPM in the tool again. Lift up steering unit and fixture in one piece and turn it 90° to horizontal.

-Housing/spool/sleeve (2)

Turn the spool set so that the pin in spool and sleeve is horizontal and push it out

STEP 8.

-Bearing (7)

Remove bearing from shaft end.

The outer washer may sometimes adhere to the housing. If the washer does not come out with the shaft, it will come out when shaft seal item 5 is being pressed out.

-Ring(10)

Remove retaining ring for the neutral position springs.

STEP 9.

-Cross pin(11)

Press the pin out of the spool set.

Carefully press the spool out of the sleeve.

-Springs (12)

Press the neutral position springs out of the spool.

-Dust seal (1)

Remove the dust seal ring (with a "sharp" screwdriver).

-Shaft seal (5)

Remove the shaft seal

(with a "sharp" screwdriver if necessary).

4. Cleaning, inspection, replacement and lubrication

Note:

a.Clean all parts carefully.

b.Carefully check all parts and replace imperfect parts, if any.

c.Always replace all sealing parts during a repair.

d.Before assembly, lubricate all parts with hydraulic oil and grease rubber parts with Vaseline.

5.REASSEMBLY

STEP 1.

-Housing (2)

Place the OSPM housing horizontally in the holding tool, with the hole for the output shaft facing the tool.

Note: the locating pin in the tool must engage with in the OSPM housing.

STEP 2.

-Shaft seal (5)

With the assembly tool the shaft seal must into the housing.

Note that the small guide piece at the front of the tool must remain in the hole for the output shaft when the tool itself is drawn out of the housing.

Note: there are two different tools:

One for housings for steering column mounting (SJ150L4011-01)

One for housings with integrated steering column (SJ150L4012-01).

STEP 3

-Spool/sleeve (2)

Guide spool and sleeve together, turn the spools so that the key slots are opposite each other.

STEP 4.

-Springs (12)

Insert the curved springs between the flat springs and push them into place (see sketch).

STEP 5.

Spring retaining ring (10)

Center the springs in the spool/sleeve set and guide the ring down over the sleeve.

Note: The ring must be able to rotate unimpeded by the springs.

STEP 6

-Cross pin (11)

Fit the cross pin in the spool set.

-Thrust bearing (7)

Fit the thick race, needle cage and thin race. Lubricate the output shaft on the inner spool with Molykote PG plastslip 75, on the surface in contact with the shaft seal.

STEP 7

-Housing /spool/sleeve (2)

a. With the housing still horizontal in the holding tool - secure it with one hand. With the other hand take the assembled spool/sleeve set, making sure two fingers hold the cross pin (11) in position. Guide the spool set into the housing with the cross pin (11) horizontal.

Note:

Be careful with the small guide piece from mounting of the shaft seal.

With it is pressed out by the shaft rotary.

b. With housing and spool set remaining in the tool, lift the whole unit into vertical position. The pin in the spool set must now point towards port P in the housing, either at 6 o'clock or 12 o'clock.

STEP 8.

-Ball (3)

Place the emergency steering ball in port P.

-Ball stop (4)

Place the ball stop in port P.

-Ball (37)

Place the check valve ball (if required) in port P

STEP 9.

-O-ring (15)

Fit the O-ring in the housing.

-Distributor plate (16)

Place the distributor plate on the housing.

Turn it so that the holes line up.

STEP 10

-Cardan shaft(13)

Fit the cardan shaft into the inner spool and allow it to engage with the pin.

If so required use fork SJ 151G9000-1to retain the cardan shaft.

STEP 11

17 Gear wheel

When fitting the gearwheel, it must be oriented correctly so that it engages with the cardan shaft.

The cross pin (11) in the spool set must line up with the bottom of the teeth in the star (see sketch).

STEP 12

-O-rings (18)

Place the O-rings in the grooves on each side of the gearwheel rim.

-Gear ring (17)

Place the gearwheel rim over the distributor plate so that all holes are in line with each other.

STEP 13.

-Spacer (14)

Place the spacer over the cardan shaft.

-End cover (19)

Place the cover so that the hole marked “P” lines up with port P in the housing(“6 o’clock” or “12 o’clock”).

STEP 14.

-Special screws (20, 22,23)

Fit screws (with O-rings). Remove the retainer fork. Tighten all five screws (cross pattern) with $30 \pm 3 \text{ Nm}$ (3 daNm).

Note:

With open center units, the screw with no oil flow connection must be fitted in port E.

If the OSPM must be mounted with a Pressure relief valve, lift it out of the tool and place it on the four pins with the axle journals upwards.

STEP 15.

-Piston (30)

Fit the piston.

-Spring (31)

Fit the spring.

STEP 16.

-Adjustment (30)

Screw in the adjusting screw.

STEP 17. (Test)

a.Lift OSPM out of the tool and prepare it for testing.

The pressure relief valve can be set either on a test panel or in a system with pressure-gauge read-off.

b.Insert plastic plug.

STEP 18.

Dust seal (1)

Guide the dust seal ring down over the shaft end press into place in the housing with assembly tool. SJ 150L0396 - 01.

Note: The dust seal must be fitted after testing so that any leakage from the shaft seal can be detected.

SECTION 5. TROUBLESHOOTING

Problems and probable causes	Counter measures
1. Steering wheel is very heavy to turn	
1) Poor assemble between steering column and unit. (1) Spline of column and unit are assembled tightly. (2) Spool of unit is seized by spline of column . (3) Poor rotation of column	-Replace column spline -Check column assembly face and spline length (MAX 6.5mm) -Replenish oil or Exchange
2) Insufficient pump pressure or fluid volume (1) Check pump delivery (Unit volume×120 rpm×1.15) (2) Check oil tank fluid volume (3) Check pump pressure	-Exchange pump -Replenish oil -Adjust relief pressure
3)Trouble internal steering unit valve (1) Low setting pressure of relief valve (2) Ball-nut heavy to work	-Adjust fluid level properly -Wash clean or replace
4)Trouble machine mechanism. (1) Poor link work (2) Excessive sector gear pre-load	-Wash and replenish oil -Adjust backlash
2. Return to neutral is too slow	
1) Poor assemble steering column and unit (1) Poor assemble to center between column and unit (2) Column assembly face depressed unit bushing	-Loosen the bolt and fix again with center -Replace column or repair
2) Depressed control set (spool+sleeve) (1) Excessive fluid volume (2) Excessive pressure (3) Dust	-Adjust fluid level properly -Adjust pressure -Wash
3) High pressure ratio of "T" port (tank port) (1) Tank port hall is small (2) Tank port pipe is linked to other lines	-MAX. Pressure ratio 20 bar -Wash and clean pipe line -Separate unit pipe line and reinstall

Problems and probable causes	Counter measures
3. Free play of steering wheel	
1) Too low elastic of centering spring (Remove P port pipe line and check left and right turning) (1) Damaged spring or poor elastic	-Replace spring
2) Depressed control set (1) Excessive fluid and pressure (2) Depressed by foreign material (3) Depressed from external when assemble with column	-Adjust fluid level and pressure properly -Wash -Check column and adjust
4. Steering wheel resistance with turning	
(1) Worn of spline gear column (2) Depressed control set (3) Air trapped in cylinder and pipe line (4) Excessive backlash column (5) Poor turning of column, or wear of bearing .	-Replace column -Wash, and Adjust fluid level and pressure properly -Deflate the air -Adjust column -Replace column and replenish oil
5. Too much free play of steering wheel (Rough touching on tire causes vibration)	
(1) Air trapped in steering cylinder and pipe line. (2) Worn ball bearing	-Deflate the air -Replace
6. Free play steering wheel	
(1) Insufficient oil in the tank (2) Worn, damage steering cylinder (3) Loose spacer in unit	-Replenish oil -Replace oil seal and cylinder -assemble spacer parts.
7. Kick-back of steering wheel	
(1) Loose check valve in "P" port or don't operate (2) Trouble in system	-Adjust check valve -consult workshop

Problems and probable causes	Counter measures
8.Serious kick-back each side	
(1)Poor assemble the gyrotor lower the unit	-Reassemble
9. Steering wheel is very heavy to begin turning	
(1)Oil density is too high or cool	-Replace oil
10. External Oil leakage	
(1)column (2)End cap gyrotor (3)Tightening Bolt	-Replace oil seal,slide ring -Replace o-ring -Replace copper washer (Torque 1st:175 kgf·cm. 2nd:280 kgf·cm)

Chapter 9 Hydraulic system

SECTION 1. GENERAL DESCRIPTION

The hydraulic system is composed of a gear pump, valves, oil filter, cylinder (actuator), piping, etc. The implement lift is operated by a control valve which is actuated by the control lever through a link mechanism.

ON and OFF of the PTO is controlled by a hydraulic, wet, multi-disc clutch whose circuit is opened and closed by an electromagnetic valve in the flow-divider.

The construction and circuit of the hydraulic system are shown in Fig.9-1 and 9-2

Fig.9-1 hydraulic system construction

Fig.9-2-1 Hydraulic Diagram(A3)

SECTION 2.SPECIFICATIONS

MODEL		T455/T555	
Piston and cylinder	Lift (at lower link top end/at 24inch link end)	1500 Kgf / 1300kgf	
Control valve	Cylinder port leaks (under a pressure of 9800KPa[(100Kgf/cm²) with gear oil of SAE 80])	5cc(0.305 Cu in)	
Main relief valve	Cracking pressure	210 Kgf/cm²	
	Relief pressure	175 Kgf/cm²	
Gear pump	Delivery(91% efficiency) : liter(cu.in)min at Rated rpm : 2800rpm	Steering	Main
		18.8 ℓ /min	38.3 ℓ /min
	Cracking pressure	125	145
	Working pressure(bar)	130	170 +5
Suction filter	Rated flow: (ℓ /min)	43	43
	Filtration density	150 mesh	150 mesh
	Filtration area	6231 cm²	6231 cm²
	Connector	1 ¼ - 12 UNF	1 ¼ - 12 UNF
Line filter (Reference)	Rated flow: (ℓ /min)	35	35
	Filtration density	100 mesh	100 mesh

SECTION 3. DISASSEMBLY AND ADJUSTMENT

1. HYDRAULIC SYSTEM

Fig.9-2

2.DISASSEMBLY

1)Remove the cylinder case assembly,referring to relevant paragraph in Chapter 2.

Fig.9-2-2

Note:
Put the cylinder case on a wooden plank to prevent the surface from damage.

2) Remove the link pin and extract the related Lift link .

Fig.9-2-3

3) Remove the cylinder head and extract the cylinder.Then remove the piston from the cylinder.

Fig.9-3

Fig.9-4

4) Applying aligning marks on the Lift shaft(26) and right hand lift arm(19),Then remove the arm

Fig.9-5

5) Applying aligning marks on the Draft shaft And Draft arm ,Then remove the shaft

Fig.9-6

6) Applying aligning marks on the Lift crank And Bar ,Then remove Bar

Fig.9-7

7) Remove the set bolt for the lift crank and remove the assembly of the lift shaft and lift arm.

Fig.9-8

8) Remove the assembly of the lift crank and piston rod.
9) Unhook the each link parts and remove the cover main control valve

Fig.9-9

Fig.9-10

10) Remove the bolt and extract the main control valve

Fig.9-11

11) Remove the following linkages:
a.Each linkage
b.position control linkage
c.Draft control linkage

3.REASSEMBLY

Reassemble in reverse order of disassembly.

3.1 GENERAL PRECAUTIONS

- 1) Hydraulic system parts should completely be free from dust before reassembly.
- 2) All O-rings should be replaced with new ones,which should be lubricated with grease before installation.
- 3) When the lift shaft is removed,the oil seal should also be replaced with a new one.
- 4) Install the piston from the cylinder bottom side.The O-ring and and back up ring should be coated with grease ahead of time.Install with care so as not to damage them.

Fig.9-12

5) When assembling the lift crank on the lift shaft, mesh their splines using the alignment marks which were put their before Disassembly

Fig.9-13

Fig.9-14

Fig.9-15

6) Tighten the Main valve securely to the specified torque

Tightening torque	130~180 Kg.cm
-------------------	---------------

Fig.9-16

Tightening torque 130~180 Kg.cm

7) When installing the control valve, apply grease to the o-rings and avoid their dislocation or binding during tightening the valve to the specified torque

8) Tighten the slow return check valve to the specified torque

Tightening torque	1000~1200 Kg.cm
-------------------	-----------------

Fig.9-17

9) Tighten the Exterior valve(remote control valve) to the specified torque

Tightening torque	200~250 Kg.cm
-------------------	---------------

Fig.9-18

Apply locktite
Tightening torque
170~250Kg-cm
Apply locktite

Fig.9-19

3.2 REASSEMBLY STEPS.

- 1) Install the main control valve
- 2) Install the clevis comp.

Fig.9-20

Note:

After installing the clevis to main control valve ,make the installed length of the set the body and plate to be 10mm(Fig.9-20)

- 3) Install the each link parts.

Fig.9-21

- 4) Install the lift crank temporarily along with the feed back link. Install the piston on the lift crank.

Fig.9-22

- 5) Install the lift shaft and lift crank together in accordance with the aligning marks on them. (Fig.9-23). Apply grease to the roll bush.

Fig.9-23

- 6) Drive the oil seal onto the lift shaft and install the lift arm.

Note:

When installing the oil seal, take care not to allow the oil seal lips to be damaged by the splines of the lift shaft.

- 7) Install the cover main control valve and Then install the remote control valve.

Fig.9-24

4. ADJUSTMENT OF THE LINK MECHANISM.

Fig.9-25

1) Adjustment of the position control link mechanism

Place the cylinder case assembly upside so that the lift arm can be moved freely

Point 1.Set the lift crank to the top position.Adjust the top position installed length of the body and plate is about 10mm or determine the position where the angle of the lift arm from horizontal is 60~ 61.5°.

Fig.9-26

Point 2. Fix the clearance between the body and plate on the control valve and the casing spool to be 10 mm,while the gap A should be 26mm (Fig.9-27),while the main spool is set in the neutral position.

Fig.9-27

Point 3. Set the feed back link so that there is no play by the adjusting nut.

Point 4. Apply an locktite to adjusting Nut.

Fig.9-28

Thus the adjustment of the position control linkage is completed.

2) Adjustment of the draft-control link mechanism

Point 1. Shift the draft-control lever to the top position and the position-control lever to the bottom position.

Fig.9-29

Point 2.

With position (A) is 90° together in accordance with Shifting the draft-control lever to the top position and the position- control lever to the bottom position.

Adjust by loosening the lock nut.

Thus the adjustment of the draft-control link mechanism is completed.

SECTION 4. MAJOR COMPONENTS OF THE HYDRAULIC SYSTEM

1. MAIN CONTROL VALVE

1.1 GENERAL DESCRIPTION (Reference)

This valve controls the lifting and lowering operation of the hydraulic cylinder. It has especially been developed to control the working height of the implement. It consists of a feed back valve; direction control valve, flow-control unloading valve, and holding check valve.

1.2 SPECIFICATIONS (Reference)

Maximum operating pressure	175 Kgf./cm ²
Maximum flow	45 liters/min
C-port leaks	5 cc/min below (Fluid temp : 50°C, Pressure : 140Kgf/cm ²)

1.3.CONSTRUCTION (Reference)

1) Main spool

- it consists of a spool, spool head, and snap ring E and has three functions.
- a. It opens and closes passages P to C and C to T and controls the passage wall area successively.
 - b. It converts unloading pilot pressure to C-port pressure or tank pressure
 - c. It turns the pilot pressure of the pilot spool on or off.

Fig.9-30

1.4 OPERATION

Port p means “pump port”, and is connected to the pump, while port C means “Cylinder port”, and is connected to the cylinder. Drain ports T1 to T4 are connected to the tank.

1) Neutral position

In the NEUTRAL position, Spring chamber of unloading valve connected to TANK(T2), Therefore the force imposed upon the right hand side of the unloading valve, then the fluid from the pump flows into TANK(T1).

The pressure in chamber becomes equal to the tank pressure. Consequently the fluid in the C port becomes high, then the check valve and main check valve completely closes the cylinder circuit enough to hold the piston steady.

Fig.9-35

2) Lifting position

When the main spool is shifted to the lifting position, Passages to the Tank(T2) are closed with unloading spring and the Fluid from the pump flows into unloading valve spring., therefore the force impose up the left-hand side of the unloading check valve, Consequently the fluid in the T1 port becomes to close the unloading.

The pump delivery fluid pressure open the loading check valve, then through C port the pump pressure flows into hydraulic cylinder to lift up the lift arm.

Fig.9-36

3) Lowering position

When Main spool is shifted to the lowering position, Unloading spring is connected to the Tank(T2),and the force imposed up the right hand side of the unloading check, therefore the fluid from the pump flows into the Tank(T1).

Consequently the force imposed up the left hand side of the main check valve, which is connected with Plate-B to open the T3 port.

By this action, the fluid from the cylinder flows out and into the tank through chamber, so the piston is released

Fig.9-37

2.FLOW-DIVIDER(PTO solenoid valve)

2.1 GENERAL DESCRIPTION

This valve is installed to bypass working fluid of a specified pressure from the main circuit into the PTO circuit through a fixed orifice. It includes a changeover valve for engaging and disengage the PTO clutch by means of a solenoid and a sequential valve for PTO circuit's over the main circuit.

Fig.9-35

(1)Solenoid

This solenoid is switched on or off by operating the PTO switch. With this lever operation, the solenoid shifts the changeover valve to the left or the right to bypass or block the flow to port B.

(2)PTO changeover valve

This valve is composed of the spool and spring. When the solenoid is switched on, the spool is moved to the left by overcoming the spring force and allows the fluid from the pump to flow from port P to port B through the fixed orifice.

-When the solenoid is switched 「ON」

The fluid from the pump flows to port B through port P, the pressure-reducing valve, and the changeover valve.

The pressure of the PTO clutch circuit and that of passage (2) are the same and will be set as P_2 . The pressurized fluid acts on the left-hand side of the valve, passing through port ; its pressure will be set as P_1 .

As passage (1) and passage (2) are interconnected, then $P_1 = P_2$.

The force imposed upon the left-hand side of the valve is P_1 whereas the force imposed upon the right side of the valve is P_1 plus the spring force. Consequently the spool is pushed leftwards.

Here port A is blocked, so the fluid from the pump is branched off to the PTO clutch.

Fig.9-36

-When the solenoid is switched 「OFF」:

The fluid in the PTO clutch is unloaded to the tank through port B. Consequently pressure P_2

at passage (2) becomes zero, whereas the pressure at passage (1) is P_1 . Then the force imposed upon the left side of spool (P_1) overcomes the force imposed upon the right side

(P_2 + spring force), so that the spool is pushed rightwards to connect port P and port A. Therefore no fluid from the pump is branched off to the PTO clutch; that is, all fluid flows to the control valve.

Fig. 9-37 PTO solenoid switch 「OFF」 position

3. PRESSURE CONTROL VALVE

3.1. GENERAL DESCRIPTION

This valve is composed of the body, plunger, piston, springs, and plug. It serves to absorb shocks which are given when the PTO clutch engages.

3.2. OPERATIONS

1) When the clutch cylinder is achieved:

When the PTO clutch valve is turned on,the cylinder is activated.Consequently the pressure in circuit does not leave the seat of body(4) because the preset force by spring(8) and spring(9) is larger.Therefore there is no flow of fluid from port B to port T,which means all the fluid from the PTO clutch leads to the clutch cylinder.

No	Part name	Q'ty
4	Body	1
5	Plug	1
6	Piston	1
7	Plunger	1
8	Spring1	1
9	Spring2	1

Fig.9-38 When the clutch stars engaging

2) When the clutch is in half-engaged state:

When the clutch cylinder is completely activated,the pressure in circuit(1) starts rising at point P1 on the graph in Fig.9-42.When the pressure reaches point P2,the piston starts moving to the right overcoming the force of spring(6 and 7). Here the flow through chock(2) causes some difference in pressure between circuit (1) and chamber (3) . As the effective area of the seat of plunger(7) for circuit(1) pressure and that for chamber(3) pressure are the same,this pressure difference causes the plunger to compress spring(9) to move to the right,which opens the passage from port B to port T1 to prevent the pressure in circuit from rising abruptly.As piston(6) moves to the right,the force of spring(8) increases so much. Both pressures in chamber(3) and circuit(1) also increases gradually,so the clutch engages smoothly without shocks.

Fig.9-39 When the clutch is in half-engaged state

Dynamic characteristics

Provided $P1=3\text{Kgf/cm}^2(43\text{psi})$

$P2=3.6\text{ Kgf/cm}^2(51\text{psi})$

$P3=5.9\text{ Kgf/cm}^2(84\text{psi})$

$T=0.4\text{-}0.6\text{ sec}$

Fig.9-40

2) When the clutch is engaged completely

When the piston(6) moves to the end, there is no flow through chock(2) and the pressures in chamber (3) and circuit(1) become equal, that is, the pressure which the plunger receives on both sides are the same. Consequently, plunger(7) is pushed back to the left by the force of spring(9), which closes the passage from port B to port T. With this, the pressure in circuit(1) starts rising at point P3 up to the supplied pressure. Thus the clutch engagement is maintained.

Fig.9-41 When the clutch is completely engaged

3.3 DISASSEMBLY AND INSPECTION

1) Required Tools

- 24 mm box type wrench and torque wrench: for valve tightening
- 22 mm box type wrench and torque wrench: for plug(5)
- Other required things: tweezers, sealing tape, rag, and oil stone

2) Disassembly

- a. Detach the change cover and remove this valve assembly
- b. Remove the plug(5) ,Take springs (9 and 8), and then extract piston(6) and plunger(7) by tilting body(4).

3) Inspection of the disassemble parts.

Inspect the plunger and the piston for dents on their friction surfaces. Such flaws must be corrected with oil stone. Wash all parts in fresh cleansing oil

4) Reassembly

a. Tightening torque

Ref.No	Fastener Name	Tightening torque[Kgf.m(ft.lbs)]
(5)	Plug	4.0-5.0(28.9-36.2)
	Valve assembly*	4.5(32.6)

*** The threads should not be wrapped with sealing tape.**

- b. Install plunger(7) into body(4) and confirm that the plunger moves smoothly. Then install piston(6), spring(8), and spring(9) in order and tighten plug(5) to the specified torque.

Fig.9-42

4. FLOW-CONTROL VALVE(SLOW-RETURN CHECK VALVE)

4.1. GENERAL DESCRIPTION

This valve regulates the lowering speed of the lift by controlling the unloading flow from the lift cylinder to the tank.

Fig. 9-43 Slow-return check valve Diagram

4.2 OPERATIONS

1) DOWN position

The fluid from port B pushes up stop ring (9) of poppet(10) until the ring comes into contact with adjust screw(6),as it reaches chamber(R). Consequently,the extent choke (C) is opened is determined by the positioning of adjust screw (6):that is,when adjust screw(6) is screwed in clockwise,the opening of chock(C) decreases and the lowering speed of the lift arm slows down;whereas the opening of choke(C) increases and the lowering speed of the lift is accelerated when the adjust screw is unscrewed counterclockwise.When the adjust screw screwed in completely,the poppet comes into contact with body seat(S) and the choke is closed completely,so the lift arm stops.

Fig. 9-44 Down position

2) Up position

The flow port A,overcoming the force of spring(11),pushes up poppet (10) and choke(C)is fully opened regardless of the position of adjust screw(6).Thus the fluid flows to port B and the cylinder,which results in raising the lift arm.

Fig. 9-45 Up position

5.SAFETY VALVE(Reference)

5.1 GENERAL DESCRIPTION

With the chock closed completely by turning the adjust screw tightly clockwise,the implement mounted on the lift is held at a specified height.While the tractor is traveling on roads in the condition,there is a possibility that the cylinder pressure will rise excessively when the implement bounces.In such a situation the cylinder pressure can rise so high as to break the cylinder.To prevent such an accident,the relief valve works to leak off the fluid in the cylinder to the tank via port P and port T to decrease the cylinder pressure

5.2 OPERATION

This valve is installed in the slow return check valve circuit and able to be installed in the cylinder case instead of Bolt.When the adjust screw of the slow return check valve is closed completely,the slow return check valve is completely closed.In this condition,when the cylinder pressure exceeds the regulated pressure of the relief valve: cracking pressure,the fluid pushed up ball(3),overcoming the force of spring(5).Then the surplus fluid is bled off to the tank via port P and Port T.

6. RELIEF VALVE

1) GENERAL DESCRIPTION

This valve regulates the maximum pressure in the whole hydraulic circuit.The regulated pressure can be set with the adjust screw.

Fig.9-46

- 1.Body 2.seal 3.Ball 4.Spring seat
5. Spring 6.Adjust screw 7.O-ring

Relief valve

Fig.9-48 relief valve

- 1.Body 2.seal 3.Ball 4.Spring seat
5. Sleeve 6.Spring 7.Spring stopper
8.Adjust screw 9.Lock nut

**2) PRECAUTIONS FOR DISASSEMBLY
AND REASSEMBLY**

- (1)Tightening torque of lock nut (9)5.0 ~ 6.0 kgf·cm²(36.2 ~ 43.4 ft.lbs)
- (2)Install seat(2)and then tap ball(3)(5/16) lightly so as to provide tight seating.
- (3)Wrap the valve threads with sealing tape and tighten the valve up to a specified torque of 5-6Kgf.m(36-43 ft.lbs)
- (4)Before disassembly, the current screwing-in depth of the adjust screw should be written down or memorized for later reference.

Measurement the Pressure must be done 3 times and should be set within specified pressure.

Specified relief pressure	170 +5 kgf·cm²
---------------------------	----------------

3) MEASUREMENT OF THE RELIEF PRESSURE

(1) 3 POINT TO TEST RELIEF PRESSURE

- ①Remove the plug on the rear side of the transmission case and install a compression gauge to measure the pressure.

Keep the engine speed at 2600 rpm and shift the position control lever at the highest position.

- ②Control valve coupler.
- ③Remove the plug in the hyd. pump flange and engage the pressure gauge and measure it.

Fig.9-49

7.GEAR PUMP

7.1 GENERAL DESCRIPTION

This pump induces fluid from one side and delivers it from the other side,by rotating two gears meshed with each other. The actual delivery is as mentioned below,considering the consequences of fluid temperature and volume efficiency in accordance with revolution speed. That is dual pump system.

Fig. 9-50 Gear pump

7. 2 OPERATIONS.

This pump induces fluid from one side and delivers it from the other side,by rotating two gears meshed with each other. The actual delivery is as mentioned Fig.9-51,Considering the consequences of fluid Temperature and volume efficiency in accordance with revolution speed.

Fig. 9-51 Gear pump

7.3 DISASSEMBLY (Reference)

NOTE:

① Before disassembling the pump, wash the outside clean. In the course of disassembling operation, all disassembled parts should be kept aside in a clean place such as on clean paper or cloth and be handled carefully so as to prevent them from becoming dirty or damaged.

Check all disassembled parts for damage and wash undamaged or usable parts in clean diesel fuel or kerosene. Inspect all parts referring to these point, and repair or replace defective parts.

(1) DISASSEMBLY

① Remove the key.

Fig. 9-52 Drive shaft key.

② Hold the pump in a vice with the mounting flange turned downward, and remove the bolts

Fig. 9-53 Cover bolt

③ Remove front and rear pump.
Be sure not to be damaged the o-ring or steel ball

Fig. 9-54 Front and rear pump

- ④ Remove the rear pump
 - ▶ Detach the cover
 - ▶ Remove the o-ring
 - ▶ Remove the bushing, drive gear, gear and bushing. Take care of removing the bushing which is marked and recorded.
 - ▶ Remove the bushing seal from the bushing.

Fig. 9-55 Front and rear pump

- ⑤ Remove the front pump same as rear pump disassembly.
- ⑥ Remove the snap ring and extract oil seal from the flange.

Fig. 9-56 Front and rear pump

3) REASSEMBLY

① Install the rear pump.

- ▶ Install the bushing seal to bushing.
- ▶ Install the bushing, drive gear, gear, and bushing to the housing.
- ▶ Install the o-ring to the cover.
- ▶ Install the cover to the housing.

Fig. 9-57 Front and rear pump.

② Install the front pump with rear pump.

③ After installing the cap ring, and O-ring to the front pump, and install the rear pump.

Fig. 9-58 Drive gear, gear, Gasket

④ Tightening sequence and torque of the pump cover tightening bolts.

- ▶ Tightening torque: 2.5 ~ 2.8 kgf·m

Fig. 9-59 Cover bolt

⑤ Install the oil seal, snap ring, and key.

Fig. 9-60 Oil seal, snap ring, key.

⑥ The gears should turn smoothly with a turning torque of less than 30 kgf.cm (2.2ft.lbs)

Fig. 9-61 Inspection after reassembly.

4) INSPECTION AND REPAIR

(1) Check all disassembled parts for damage and wash undamaged or usable parts in clean diesel fuel or kerosene except rubber parts. Inspect all parts referring to these points, and repair or replace defective parts.

(2) Housing(casing)

- ① The gear pump is originally designed so that the gears come into light contact with the side of the pump body
- ② Therefore some evidence of contact can be found around the intake port of a pump once used.
- ③ The normal contact tracing is less than half the length of the gear housing bore and less than 0.05 mm (0.0020 in) in width. If width A is more than 0.1 mm (0.004 in), replace the gear pump set.

Fig. 9-62 Housing (casing)

Fig. 9-63 Housing (casing)

(3) Bushing

- ① With clean working fluid, surfaces are rarely scratched and should be smooth.
- ② If there are many scratches on the bore walls, or on parts which are in contact with the gears, which can be readily felt or when the latter parts are darkened, the gear pump set should be replaced.

Fig. 9-64 Bushing

Problem and causes are as below

- a. contaminated fluid
- b. overload by relief valve damage
- c. cavitation or aeration
- d. overheat of fluid.
- e. Low density of fluid

- ④ Some evidence of contact can be found around the intake port of a bushing once used. The normal contact tracing is less than half the length of the bushing bore and less than 0.03 mm (0.0012 in) in width. If width is more than 0.03 mm (0.0012 in), replace the bushing.

Fig. 9-65 Bushing

(4) GEAR

- ① With clean working fluid, surfaces are rarely scratched and should be smooth.
- ② If roughness can be felt by a finger nail, they are darkened, or the shaft diameter is less than **0.03 mm** replace the shaft.
- ③ Usable shaft diameter is as below

Shaft diameter less than 0.03

Fig.9-66 gear shaft

(5) Oil seal

The oil seal prevents oil leaks by its inner seal lip and dust from invading by its outer dust lip. Therefore if an oil seal has damaged or deformed lips, it should be replaced.

(6) MEASUREMENT OF THE PUMP

The best way to measure for the pump is to use a special tester.

But if it's not available, Use installed tractor
Remove the plug in the delivery pipe on the right-hand side of the transmission case and install a compression gauge to measure the pressure.

Keep the engine speed at 2600 rpm and shift the position control lever at the highest position.

8. FILTER

48.Filter assy,suction

48-02.Element

8.1 GENERAL DESCRIPTION

The tractor is equipped with two oil filters: suction filter(48) and line filter(4),for better filtration.

8.2 SPECIFICATIONS

1)Suction filter

Model	T455/T555
Applicable oil	THF 500
Rated flow rate(ℓ/min.)	
Filtration density	150 mesh
Filtration area	7084cm ²
Working oil temperature (°C)	-30 ~ 130°C

2) Line filter

Rated flow((ℓ/min.)	35
Filtration density (mesh)	100 mesh

8.3 REPLACEMENT

Check the O-rings for damage or deformation and replace defective ones.When installing the filters,be sure to install the O-rings properly with grease applied.

SECTION 5. REMOTE HYDRAULIC CONTROL

1.GENERAL DESCRIPTION

- A hydraulic operated implement can be driven and controlled with this optional remote hydraulic control valve set.
- The valve is connected between the gear pump and the main control valve and is given a priority to draw hydraulic power.
- The valve is installed on the right-hand side of the hydraulic cylinder case and the connecting ports are provided under the right hand step .

SECTION 6. TROUBLESHOOTING

Problems	Causes	Countermeasures
1.Lift does not rise	1) Insufficient engine speed	Raise engine speed slightly
	2) Insufficient transmission oil	Maintain oil level by replenishing with the same kind of oil
	3) Air taken in through suction	Tighten securely or replace broken parts.
	4) Clogged suction filter	Clean.
	5) Broken or poor hydraulic pump	Inspection pump and repair or replace if necessary.Pay particular attention to shaft seal because a broken seal sometimes intakes air.
	6) Poor link mechanism	Inspect,adjust,repair,or replace if necessary.(Refer to section 3)
	7) Excessive load on lift	Decrease load
	8) Broken cylinder	Replace
	9) Too low viscosity of transmission oil	As it will cause oil leaks or internal wear,replace with gear oil of SAE80
	10)Maladjusted relief valve	Readjust. (Cracking;refer to the specifications)
	11)Excessive internal leaks	Inspect cylinder and valves.Replace damaged seals,and repair. (Check each part systematically)
	12)Broken flow divider (Stuck sequential valve spool)	Disassemble and wash spool clean. If it is damaged seriously,replace it as an assembly.If damage is minor,correct surface with oil stone and finish by lapping.
	13)Broken control valve (Even when spool is shifted to up position,lift does not rise)	
	①Stuck compensator plunger (unloading valve 1)	Lap after repairing flaws with oil stone
	②Clogged orifices or slanted orifices in pilot passage.	Clean them with compressed air or a sharp point.
	③Stuck poppet(unloading valve 2)	Correct minor flaws with oil stone
	④Bitten or stuck check valve plunger	Lap after repairing flaws with oil stone
	14)Broken slow-return check valve	
	①Stuck poppet	Lap after disassembling,cleaning, and repairing flaws with oil stone

Problems	Causes	Countermeasures
2. Too low rising speed of lift	1) Above causes can also be possible	Repair according to above instructions.
	2) Too small a spool stroke in control valve	Inspect, readjust, or replace link mechanism if necessary.
	3) Broken compensator spring (unloading valve 1) in control valve	Replace spring.
	4) Stuck poppet (unloading valve 2)	Correct minor flaws with an oil stone
3. Lift lowers even when adjust knob is closed fully with adjust Handle (While engine is stopped)	1) Stuck poppet	Lap after disassembling, cleaning, repairing flaws with oil stone
	2) Poor valve seat	Replace valve
	3) Poor O-ring	Replace
4. Lift does not lower	1) Slow-return-check valve knob is turned to the lock position	Turn knob to fast position
	2) Stuck poppet of slow-Return-check valve	Lap after disassembling, cleaning, repairing flaws with oil stone
	3) Seized lift shaft	Apply grease and repair or replace bushings or shaft if necessary.
	4) Stuck main spool	Lap lightly after disassembling, cleaning, and repairing flaws with oil stone or replace as an assembly.
5. Too slow lift lowering speed	1) Above mentioned causes can also be possible.	Repair or adjust according to instructions mentioned above.
	2) Insufficiently lowered control lever	Lower lever sufficiently
	3) Excessively closed slow-return check valve	Open valve sufficiently
6. When hydraulic control lever is raised, relief valve beeps.	1) Maladjusted lever stopper check valve	Readjust lever stopper guide position
	2) Poor link mechanism	Inspect, readjust, repair, or replace link mechanism if necessary.
7. Fluid overheating	1) Excessively high working pressure	Inspect and adjust
	2) Too high or low viscosity of working fluid.	Replace with fluid of adequate viscosity.
	3) Insufficient fluid	Maintain specified level by replenishing

Problems	Causes	Countermeasures
8.Pump noise	1) Partially clogged suction filter or suction piping.	Clean.
	2) Air inhaled through suction piping and intake pipe connections for pump	Inspect and retighten.
	3) Loosened pump cover tightening bolts.	Inspect and retighten
	4) Too rich oil viscosity	Replace with fluid of adequate viscosity.
	5) Broken or worn pump parts	Inspect and replace defective parts.
9.Excessive wear,deflection or damage of pump	1) Dirty fluid	Eliminate foreign matter and inspect filters.
	2) Circuit pressure exceeds pump capacity	Adjust relief valve or replace if necessary
	3) Oil-less operation due to Insufficient oil quantity	Inspect transmission oil level and maintain specified oil level by replenishing.In either case,clean, and repair pump parts and replace damaged ones if necessary.
10.Oil leaks outside pump	Broken or fatigues oil seal or O-ring	Replace
11.Oil leaks from piping or joints	Poorly connected piping	Inspect,clean,and eliminate dust. Repair flaws with oil stone if necessary. Retighten.
	Poor O-ring	Replace
	Broken piping	Replace with a new one after washing clean related parts.
12.Oil leaks around lift arm	Poor oil seals	Replace oil seal or bushing if necessary
13.Independent PTO clutch slips or is too slow in engaging	1) Clogged fixed orifice of Flow divider	Disassemble and wash clean.
	2) Port B regulated pressure is too slow	Inspect and reset pressure
	3) Clogged PTO pressure control valve or stuck	Disassemble and wash clean. Repair flaws with oil stone if necessary or replace with a new one.
	4) Poor flow divider solenoid valve	Disassemble and repair or replace with new one if necessary .

Problems	Causes	Countermeasures
14.Independent PTO clutch is too quick in engaging	1) Stuck pressure-reducing valve spool	Lap after correcting flaws with oil stone
	2) Fatigued or broken pressure- reducing valve spring	Replace.
	3) Worn or broken sealing of PTO clutch	Replace
	4) Worn friction plates or driven plates	Replace
	5) Overheated fluid	Refer to paragraph for "fluid overheating"
	6) Port B regulated pressure is too high of Flow-divider	Inspect and reset pressure
	7) Stuck pressure-reducing valve spool	Lap after correcting flaws with oil stone
	8) Clogged orifice in pressure- reducing valve spool	Clear clogged with compressed air or with a sharp point.

Chapter 10 Electrical accessory and instruments

SECTION 1. GENERAL DESCRIPTION

The basic electrical system of tractors consists of the engine cranking system ,battery charging system,lighting system,meters,switches,etc.

For further information concerning the engine cranking equipment and battery charging equipment, please refer to the engine manual.

The battery is a power source to activate the engine cranking system,lighting system,and other electrical equipment. The lighting system is used to activate the illumination lights, indicators, and signal lights. The meter is a device that enables the operator to be aware of the present operating conditions;oil pressure gauge,water temperature gauge (thermometer), fuel gauge, etc. are installed. All the controls,meters, and indicators are arranged around the operator’s seat for easy Maneuverability readability,and convenience.

SECTION 2. SPECIFICATIONS

MODEL			T455/T555	
PART NAME			Specification(w)	Quantity
1.lighting system	Head lights		55/55	2
	Front combination lights	Turn signal lights	21	2
		Small lights	8	2

4.Battery			12V100AH	1

SECTION 3. BATTERY

1.INSPECTION

1.1 INSPECTION OF ELECTROLYTE LEVEL

As the battery repeats charging and discharging during operation.The water content in the electrolyte gradually evaporates, and as a result,the level should be inspected at the specific level;replenish with distilled water.

Fig.10-1 electrolyte level

1.2 INSPECTION OF ELECTROLYTE SPECIFIC GRAVITY

The specific gravity of the electrolyte lowers as the battery discharges,so the battery condition can be determined by measuring the specific gravity.The specific gravity can be measured generally with a suction type hydrometer which must be read properly as shown in Fig. 10-2

Fig.10-2 electrolyte gravity

Note:

When the distilled water is added,charge the battery to mix it well into the electrolyte before measuring the specific gravity.

a.Temperature correction of the hydrometer reading

The specific gravity of the battery electrolyte(diluted sulfuric acid) varies with the temperature of the electrolyte at a rate 0.0007 specific gravity point for each 1°C change in temperature.Therefore, when the specific gravity of the electrolyte in the battery is measured with a suction type hydrometer,a temperature correction should be made,using the following formula to permit the direct comparison of the measured value with the standard specific gravity at 20 °C.

$$S_{20} : S_t + 0.0007(t - 20)$$

S_{20} : Specific gravity at standard temperature of 20 °C.

t : Temperature of the electrolyte at the time of measurement

S_t : Specific gravity of the electrolyte measured at t °C.

1.3 BATTERY CHARGING

If the specified gravity of the battery electrolyte in lower than 1.220 (at 20 °C),the battery should be recharged,because leaving an undercharged battery without recharging it will lead to permanent battery damage.The battery is subject to self-discharge at a rate as shown in the table below.Therefore it should be recharged from time to time when storing the battery unused for a long period of time.

When recharging the battery,wash clean the outside of the battery case and the battery posts.Check the level of the electrolyte in each cell and replenish with distilled water as necessary.

Temperature	Self-discharge rate per day (%)	Decrease in specific gravity per day
30 °C	1	0.002
20 °C	0.15	0.001
5 °C	0.025	0.005

1.4 BATTERY TESTING CHARTS

Step 1.

VISUAL INSPECTION

Step 2

Step 3

Voltage table	
Estimated electrolyte temperature	Minimum required voltage under 15 sec.load (Use ½ these values for 6-V batteries)
70 °F (21 °C) and above	9.6
60 °F (16 °C)	9.5
50 °F (10 °C)	9.4
40 °F (4 °C)	9.3
30 °F (-1 °C)	9.1
20 °F (-7 °C)	8.9
10 °F (-12 °C)	8.7
0 °F (-18 °C)	8.3

SECTION 4. METERS AND SWITCHES

1.METERS

1.1 Removal

- a. Disconnect the cable from the negative post.
- b. Remove the philips screw which hold the meter panel and lift up the panel assembly a little

Fig.10-3 Meter panel

- c. Then the meter panel can be detached by removing the wire harness couplings.

Fig.10-4 Wire harness

1.2 Tacho/hour meter and sensor

a. Construction

An electric tachometer is employed along with a Tachosensor. The tach/hour meter converts engine revolutions to electric signals, which is sent to the tachometer from ECU. The tachometer displays the engine revolutions visually.

The generated pulses are converted into voltage output through a converter. Then the voltage is divided into three different phase coils through a IC circuit. The tachometer pointer is swung by the compound magnetic field generated by the three point.

b. Inspection

-Tachometer
The allowable error of a tachometer reading is specified as shown on the table below. If the reading deviates from the specified value, replace the meter assembly.

Engine speed(rpm)	1000	2500
Allowable error(rpm)	±150	±150

1.3 Fuel gauge and Fuel gauge sensor

a. Construction

When the fuel tank is full, the float is at the top and has moved the variable resistor to a position of least resistance. This feeds maximum current into the meter circuit and the pointer swings fully to the F position. Consequently when the fuel level in the tank is low, everything acts in reverse.

Fig.10-5 Fuel gauge sensor

b.Inspection

-Fuel meter

Connect the fuel gauge to form a circuit with the resistors as shown Fig.10-6 and check to see if the gauge pointer swings to each position: F,1/2 and E by changing the resistance value. If it does not,change the gauge assembly.

Fig.10-6

-Fuel gauge sensor(variable resistor)

Check each resistance value with a tester at each float position as shown in Fig.10-7.if the measured values are deviated from respective specified values,replace the sensor assembly.

Fig.10-7

Standard pointer position	F	(1/2)	E
Regulated resistance(Ω)	3	32.5	110
Sensor Unit resistance(Ω)	± 2	± 4	± 7

Note:

- 1) Figures in parentheses are reference value
- 2) Inspect each position in order F to E
- 3) Read values in three minutes.

1.4.Thermometer

a. Construction

This is the same moving magnet type meters as the fuel gauge.As the coolant temperature becomes higher,the resistance in the thermo unit(sensor) become lower,which results in more current to the meter circuit and swinging the meter pointer to the high temperature side on the scale.Of course,as the coolant temperature become lower,everything acts in reverse.

b. Inspection

Normally the thermometer resisters higher values as the coolant temperature rises after the engine is running.If it does not,check the wiring first. If the wiring is normal.Replace assembly.

2. STARTER SWITCH

(1) Removal

- a. Remove the dash cover(Upper)
- b. Remove the ring nut holding the starter switch using a conventional screw driver.
- c. Pull out the key switch as shown in Fig.10-8

Fig.10-8

(2) Inspection

a.The main switch circuit,switching positions, and terminals are as shown in the figures. Check the continuity across respective terminals referring to the switch circuit diagram. Replace a defective switch as an assembly

Fig.10-9

Fig.10-10

3. COMBINATION SWITCH

1) Removal

- (1) Remove the meter panel
- (2) Remove the light switch knob and turn signal switch lever.

Fig.10-12

- (3) Release the ring nut with a conventional screw drive(-) and remove the combination switch.

2) Inspection

Each switch circuit is as shown,so check each switch for a continuity across respective terminals with a tester.Replace a defective switch as an assembly.

SECTION 7. TROUBLESHOOTING

Important: Whenever effecting a repair the reason for the cause of the problem must be investigated and corrected to avoid repeating failure.

The following table lists problems and their possible causes with the recommended remedial action

1. LIGHTING SYSTEM

Problems	Causes	Countermeasures
Several or all lights do not illuminate	Discharged battery	Check battery and charge or renew
	Loose or defective battery cable connection	Inspect,clean,and tighten connection
	Loose wire harness connectors	Check and ensure connectors securely engaged
	Burnt out fuse or fusible link	Inspect and renew.Check circuit before re-connecting power
	Faulty wiring	Check lighting Circuit wiring and repair or renew
	Defective light switch	Check and renew
	Several light bulbs burnt out due to defective voltage regulation	Check and renew voltage regulator (Alternator)
Individual lights do not illuminate	Burnt out bulb	Check and renew
	Defective or corroded bulb contact	Inspect,clean or renew
	Burnt out fuse	Inspect and renew.Check circuit before reconnecting power
	Loose or broken wires	Inspect ,secure,repair,or renew wiring
	Poor ground connection	Inspect,clean, and tighten ground connection
Lights burnt out repeatedly	Faulty voltage regulator	Check and renew voltage regulator (Alternator)
Turn signal lights do not illuminate	Blown fuse	Inspect and renew.Check circuit before re-connecting power
	Inoperative flasher unit	Check and renew
	Inoperative turn signal switch	Check and renew
	Defective wiring or connections	Inspect circuit,clean,and tighten connection. Repair or renew wiring if necessary

Problems	Causes	Countermeasures
Individual turn signal light does not illuminate	Burnt out bulb	Check and renew
	Corroded or loose bulb contacts	Inspect, clean, and renew
	Poor ground connection or damage wiring	Inspect, clean, and tighten connections or renew wiring
Turn signal pilot light is inoperative	Faulty bulb	Check and renew
	Defective flasher unit	Check and renew
	Faulty wiring or connections	Inspect, clean, and tighten connections or renew wiring
Stop lights does not illuminate	Inoperative stop light switch	Check and renew
	See “Individual lights do not illuminate”	See “Individual lights do not illuminate
Inoperative work light	Work light switch is not turned on	Ensure work light illuminates
	See “Individual lights do not illuminate	See “Individual lights do not illuminate

2. INSTRUMENTATION

Problems	Causes	Countermeasures
Inoperative or erratic meters	Loose or broken wiring	Inspect Circuit, tighten connections or renew wiring
	Defective meters	Inspect and renew
	Defective sensors	Check and renew
	Defective Voltage regulator	Check and renew voltage regulator (Alternator)
Monitor light does not illuminate	Loose or broken wiring	Inspect circuit, tighten connections or renew wiring
	Faulty main switch	Check and renew
	Burnt out bulb	Check and renew
	Burnt out fuse	Check and renew
	Defective switch	Check and renew
	Loose or broken wiring	Check and renew
PTO does not operate	Burnt out fuse	Inspect and renew. Check circuit
	Loose or broken wires or connections	Inspect circuit, tighten connections, or renew wiring
	Defective PTO switch	Check and renew
	Defective PTO solenoid	Check and renew

Problems	Causes	Countermeasures
Inoperative horn	Burnt out fuse	Inspect and renew.Check circuit before re-connecting power
	Loose or broken wires of connections	Inspect circuit,tighten connections,or renew wiring
	Defective horn switch	Check and renew
	Defective horn	Check and renew

3.GLOW SYSTEM

Problems	Causes	Countermeasures
All glow plugs do not heat red	Discharged Battery	Check battery and charge or renew
	Loose or defective battery cable connections	Inspect,clean,and tighten connections
	Loose wire harness connections	Check and ensure connectors securely engaged
	Burnt out fusible link	Inspect and renew.Check circuit before re-connecting power
	Faulty wiring	Check glow plug circuit wiring and repair or renew
	Defective main switch	Check and renew
Individual glow plug does not glow	Defective glow plug	Check and renew
	Defective or corroded glow plug contacts	Inspect,Clean,or renew
	Loose or broken wires	Inspect,secure,repair,or renew wiring
Glow monitor light does not illuminate	Defective controller	Check and renew
	Defective glow monitor light or monitor and warning check unit	See”Light system troubleshooting”

4. STARTING SYSTEM

Problems	Causes	Countermeasures
Starter motor does not spin	Discharged battery	Check battery and charge or renew
	Defective stop light switch	Check and renew
	Defective key switch	Check and renew
	Defective starter motor connections or loose battery connections	Check,clean and tighten connections
	Faulty starter motor	Inspect,repair,or renew
	Defective master brake pedal	Inspect and try to push brake pedal
	Faulty reverse or forward pedal	Inspect ,adjust neutral
	Defective push switch	Check and renew
	Defective controller	Check and renew
Engine cranks slowly	Discharged battery	Check battery and charge or renew
	Excessive resistance in starter circuit	Check circuit connections and repair or renew faulty wiring
	Defective starter motor	Refer to the engine manual
	Tight engine	Refer to the engine manual

5. CHARGING SYSTEM

Problems	Causes	Countermeasures
Battery is low in charge or discharge	Loose or worn alternator drive belt	Check and adjust belt tension or renew
	Defective battery:It will not accept or hold charge.Electrolyte level is low	Check condition of battery and renew
	Excessive resistance due to loose charging system connections	Check,clean,and tighten circuit connections
	Defective alternator	Check and repair or renew
Alternator is charging at high rate (Battery is overheating)	Defective battery	Check condition of battery and renew
	Defective Alternator	Check and repair or renew
No output from alternator	Alternator drive belt is broken	Renew and tension correctly
	Loose connection or broken cable in charge system	Inspect system,tighten connections and repair or renew faulty wiring
	Defective voltage regulator	Check and renew
	Defective alternator	Check and repair or renew

Problems	Causes	Countermeasures
Intermittent or low alternator output	Alternator drive belt is slipping	Check and adjust belt tension or renew
	Loose connection or broken cable in charge system	Inspect system,tighten connections and repair or renew faulty wiring
	Defective alternator	Check and repair or renew
Warning light dims	Faulty external charging circuit connections	Inspect system,clean and tighten connections
	Faulty rotor slip rings or brushes	Inspect and repair or renew
	Defective monitor and warning unit	Check and renew
	Faulty rectifier or rectifying diodes	Check and renew
Warning light is normal but battery is discharged	Defective voltage regulator	Check and renew
	Faulty starter	Check and renew
	Faulty rectifier or rectifying diodes	Check and renew
Warning light is lit during operation	Loose or worn alternator drive belt	Check and adjust tension or renew
	Defective diodes	Check and renew
	Faulty rotor,slip rings,or brushes	Inspect,repair,or renew
	Defective starter	Check and renew
	Defective rectifier or rectifying diodes	Check and renew
Warning light flashes intermittently	Faulty external charging circuit	Inspect circuit,clean,and tighten connections.Repair or renew faulty wiring
	Alternator's internal connections	Inspect and test circuitry,Repair or renew

CHAPTER 11. Cabin

SECTION 1. GENERAL DESCRIPTION

The cab fully conforms to the international standard as far as safety and soundproofing are concerned. It can be provided with ventilation, heating and air-conditioning system.

It is available in the following version.:

- Cab with ventilation and heating systems
- Cab with ventilation, heating and air-conditioning systems.

The cab is in full conformity with the international standards as to the cab's soundproofing.

Be very careful when operating in small spaces and always protect your ears whenever other working equipment is generating dangerous noise levels.

Fig.11-1 Rear side of Cabin

Fig.11-2 ISO view of Cabin

Note :

Cabin can be Lifted up from transmission and gradually making sure that all relevant wiring. Piping, cock and links are disconnected.

Fig.11-3 Remove the Cabin assembly.

Remember that steering, braking and operational performances are highly influenced by the implements mounted, the trailers transported and the ballasts applied to the tractor.

When transporting heavy loads (exceeding the weight of the tractor) reduce the speed under 15 Km/h..

All the implements mounted onto the tractor must be safely secured.

Be very careful during implement hitching and unhitching operations. When using implement supports, be sure they are suitable and sufficiently strong.

Section 2. INSTRUMENT AND RELATED PARTS

■ Doors:

The doors are provided with key locks.

To open from the outside, when unlocked, depress the push button.

To open from inside, push the lever downwards.

■ Rear Window:

The rear window is fitted with central handle for opening.

When opened it is held in place by two dampers.

■ Side Window:

The side window is fitted with central handle for opening.

When opened it is held in place by holder.

■ Working lamp switch is installed to right side frame and can be extracted as shown Left figure

Fig.11-3 Windows and working lamp switch

■ Working lamps (front and rear) :

The working lamps are located on the cab roof (two in the front and two in the rear) .They are switched on by means of the special switches on the roof console

■ Rearview mirrors.:

The cab is provided with rearview mirrors on both sides. They can be adjusted and folded, whenever necessary, to avoid interference with external obstacles.

The mirror have a telescopic arm to allow positioning for maximum convenience by the user.

Remember that mirrors must always be positioned in compliance with road traffic regulations when driving on a public highway.

■ Cab ceiling:

The ceiling is padded with insulation material to block heat radiation into the cab and keep the temperature down when working in very sunny areas.

The cab platform is covered with a “firm grip” carpet in the most commonly used areas.

It is recommended to keep this carpet clear of earth, mud, etc. so that the operator may get on and off the tractor in full safety.

Section 3. Controls

Fig.11-4 Cabin interior

VENTILATION

The ventilation unit is housed in the cab ceiling.

To switch it on and adjust it, turn the electrical fan switch to the desired speed.

The cab becomes slightly pressurized when the ventilation system is in operation, so that the fresh air can enter only by way of the filter installed in the rear section of the cab roof.

The fan switch can be operated only after the ignition key is inserted.

The air flow can be regulated and directed by suitable positioning the air diffusers.

Air can be taken in fresh from outside or recirculated from within the cab by way of the relative side inlets

■ Re-circulation inlets fully closed:

Air is taken in entirely from outside the cab through the rear grille and filtered through a paper element positioned behind the grille.

N.B-it is very important that the air diffusers never be completely closed so as to allow for a steady air flow.

To obtain a greater pressurization inside the cab, it is necessary to take the air from the outside, therefore the inside air recirculating grille should be fully closed.

■ Working lamp switch

The front and rear working lights are ON when push the button. The work light indicator lamp on the instrument cluster will illuminate.

■ Wiper control switch

- Switch ON

The Wiper switch is ON when Push the Top button.

The Washer switch is ON when Push the Mid-button.

- Switch OFF

Once again push the buttons.

■ Windscreen Washer tank

Check the level of windscreen washer fluid in the plastic reservoir located at the front of the radiator

During winter, it is advisable to add a suitable antifreeze or methyl alcohol to the windscreen washer fluid.

■ Interior Lamp

Push the button to light on

And push it again to light off

■ Blower control switch

Three position rocker switch

Fig.11-5 Blower control Switch

■ Temperature control

Set temperature control as required,fully clockwise

For maximum cool and fully counterclockwise for heat.

Temperature control

■ Air conditioning switch

To operate the air conditioner,the blower must be on.The blower speed temperature control and all vents must be adjusted to obtain the best cooling for the ambient temperature and dust conditions.

Under normal operating conditions, and the windows and doors closed, temperatures in the cab of 6°C to 15 °C (10 °F to 25 °F) less than the ambient temperature will occur.

When operating the air conditioner system, the moisture level is decreased.

NOTE:

- 1) During cold weather,with ambient temperature above 0 °C (32 °F) operate the air conditioner at least once per month,for a period of 10 to 15 minutes.This will lubricate the seals to prevent them becoming brittle and help prevent the loss of refrigerant from the system.
- 2) The system is equipped with an environmentally safe refrigerant,R134a.Never recharge the air conditioning system with refrigerant other than R134a as this will result in loss of cooling and permanent damage to all air conditioning components

■ Circulation diffuser

With the circulation vent set in any position outside Air will still be pulled into the cab.

Circulation diffuser

Fig.11-6 circulation diffuser

Section 4 HEATING SYSTEM

General description

The heater is switched on and adjusted by rotating the control knob at the roof console, then switching on the blower and setting the selector at the preferred speed .

To warn the cab up quickly, the knob should be rotated fully clockwise and the blower set to speed 3. The screen is demisted or defrosted by air directed through a slot vent . For defrost or fast demist, all other vents should be closed off.

IMPORTANT:

Ventilation is provided by a single blower unit serving both the heating system and the air conditioning system.

After reaching the desired temperature adjust the system to suit your needs.

NOTE:

-For ideal system operation, the engine must run at 1000 rpm

Fig.11-7 heating system

1. Speed heating fan 2.Electric resistances 3.Recirculation inlets 4.Pivotal air diffuser 5.Air filter

 Warning	Before starting the engine, make sure the system is off (by turning off the ventilation fan) so as not to overload the battery. After the system at full power for a long period of time, never turn it off suddenly but let it first idle for about 20 seconds.
---	--

SYSTEM CONFIGURATION

1.The heating system consist of two units:

- 1-Electric heater and blower unit installed behind roof console.
- 2-Power supplying set, consisting of an auxiliary alternator located front of the engine and driven by a belt directly linked to the engine pulley.

If the air does not come out from the diffusers right away as soon as the system is started, turn off immediately and identify the fault.

N.B-Never turn on the heating system when working in dusty environments.

Fig.11-8 compressor and related parts

■ **Compressor belt adjustment**

Check the compressor belt tension regularly and adjust If required.

The correct tension is if the center of the belt is Pushed With a finger it moves in approx. 10 mm (0.39 in)as shown in the picture.

To adjust the belt, loosen or tighten the nut as shown in the picture.

Section 5. AIR CONDITIONING SYSTEM

The system is designed to ensure optimum temperature inside the cab and maximum comfort and safety for the operator.

However, it is advisable to consult our specialized workshops whenever repairs or adjustments need to be performed.

Do not approach the system with open flames, as any escape from the circuit may produce a lethal gas.

Fig.11-9 Air conditioning system

AIR CONDITIONING SYSTEM

Fig.11-10 Air conditioning system and related parts

■ **Roof hatch**

Ventilation-push the latch towards the front of the tractor and then push the hatch up.

Emergency Exit-Push firmly upwards to release the support struts from the lower retainer clips.

■ **Cab Air intake filter**

The 《Paper》 filter is not suitable for the treatment of pesticides

and so must be replaced by an **ACTIVE CARBON》 FILTER**

available optionally. Once the pesticide treatment is finished, it is necessary to once again replace the “ACTIVE CARBON” filter with the paper filter, since this is the only type suited for filtering foreign particles from the air.

Optional **ACTIVE CARBON** FILTER is informed to parts Catalogue

Fig.11-11 Air filter

■ **At Regular intervals**

(According to the operating conditions): clean filter(16 fig.11-12).To gain access to the filter it is necessary to loosen the two knobs fixing the side grill and the filter support, then remove the filter. Filter cleaning is performed as follows:

- 1.Direct a jet of compressed air (Max.6 bar) in the direction opposite to that of the filtering action until the dust is completely removed.
- 2.Do not wash with a water and or detergent solution because this element filter is basically paper.

 Warning	Cab air filters remove dust in the air, but are not capable of removing chemicals used in spraying crops or in weed control. Many chemicals used for these purposes are toxic when improperly used, and can be hazardous to operators and others in the area. Follow the instructions of manufacturers of both the equipment and the chemicals regarding prohibition of dust or spray, personal hygiene practices, and other precautions noted by the manufacturers.
---	---

■ **Radio, CD player (If equipped)**

Located into the top of the cabin,
And it can be extracted by removing fixing bolts in the cabin

Fig.11-12 Radio ,CD player

■ **Ash tray**

Located at right side of near side window in cabin.

■ **Cup Holder**

Put the bottles and Personal belongings.

■ **Cigarette Lighter**

Push the button. Use that is retune to original position.

1.SAFETY PROCEDURES.

 Warning	This safety alert symbol indicates important safety messages in this manual. when you see this symbol, carefully read the message that follows and be alert to the possibility of personal injury or death
--	--

Refrigerant R134a is the most stable and easiest to work with refrigerants now in use in air conditioner systems. Refrigerant R134a does not contain any chlorofluorocarbons (CFC's) which are harmful to the earth's ozone layer.

Safety procedures must be followed when working with Refrigerant R134a to prevent possible personal injury.

- 1.Always wear safety goggles when doing any service work near an air conditioner system.
Liquid refrigerant getting into the eyes can cause serious injury. Do the following if you get refrigerant near or in your eyes.

- A.Flush your eyes with water for 15 minutes.
B. See a physician immediately.

2. A drop of liquid refrigerant on your skin will cause frostbite. Open the fittings carefully and slowly when it is necessary to service the air conditioner system.
Your skin must be treated for frostbite or a physician must be seen if you get refrigerant on your skin.

- 3.Keep refrigerant containers in the correct upright position. Always keep refrigerant containers away from heat or sunlight.
The pressure in a container will increase with heat.

- 4.Always reclaim refrigerant from the system, if you are going to weld or steam clean near the air conditioner system.

- 5.Always check the temperature and pressure of the air conditioner system before reclaiming the refrigerant and when you test the system.

- 6.Never leak test the system using a flame tester. Dangerous gas can form when refrigerant comes in contact with an open flame. Never permit fumes to be inhaled.

7. Never leak or pressure test the system with compressed air or oxygen.
Refrigerant R134a in the presence of air or oxygen above atmospheric pressure can form a combustible gas.

 Caution	Never operate the engine in a closed building. Proper ventilation is required under all circumstances.
--	--

 Caution	Never touch liquid refrigerant, since even a small drop on your skin will cause severe and painful frostbite. Always wear protective gloves.
--	--

 Caution	Always wear safety goggles when working with liquid refrigerant. Liquid refrigerant in your eyes could cause blindness.
--	--

 Caution	DO NOT use steam to clean any air conditioner system parts while the system is charged. The heat may cause the refrigerant to rise in pressure that can cause the system to explode
--	---

2. OPERATION

The air conditioner system contains five major components: Compressor, receiver drier, expansion valve and evaporator. These components are connected by tubes and hoses and operate as a closed system. The air conditioner system is charged with R-134a refrigerant..

The compressor receives the refrigerant as a low pressure gas. The compressor then compresses the refrigerant and sends it in the form of a high-pressure high temperature gas to the condenser. The airflow through the condenser then removes the heat from the refrigerant. As the heat is removed the refrigerant changes to the high-pressure liquid.

The high-pressure refrigerant liquid then flows from the condenser to the receiver drier. The receiver drier is a container filled with moisture removing material, which removes any moisture that may have entered the air conditioner system in order to prevent corrosion of the internal components of the system.

The refrigerant still in a high pressure liquid form, then flows from the receiver drier to the expansion valve then causes a restriction in flow of refrigerant to the evaporator core, lowering the pressure of the liquid.

As the refrigerant flows through the evaporator core the refrigerant is heated by the air around and flowing through the evaporator fins. The combination of increased heat and decreased pressure causes the refrigerant to evaporate and form a low pressure gas.

The evaporation causes the airflow through the evaporator fins to become very cool. The cool air then passes from the evaporator to the operators cab.

The low pressure refrigerant gas return to the compressor to repeat the cycle.

Fig.11-18

3. Checking the air conditioning system.

①Economic friendly refrigerant : R134a 0.7 ~ 0.85Kg.

The presence of air and water in the system could jeopardize its efficiency.

- The air is uselessly compressed by the compressor and no cooling effect is produced.
- The moisture has a tendency rise to obstructions which prevent the cooling efficiency.

② Check belt tension ; when finger pressure is applied to the mid-point between both pulleys.

③ Condenser fins must always be duly clean using water or an air set.

4. Checking the air conditioning system charge

(1) Check the refrigerant charge.

- A.Run the engine at 1500rpm
- B. Set the air conditioning system in the coldest for 5 minutes.
- C. Check the sight glass dear or cloud

 Caution	If the air-con. is operated with not charged. The lubrication in the compressor can cause the damage.
---	--

(2) Check the refrigerant with receive drier sight glass

	Bubbles or foam visible	Trouble shoot	
	● Bubbles flow and refrigerant gas disappeared like a fog flows	● Deficient of refrigerant Replenish ● Nothing different temperature between H.L pipe ● High pressure of the pressure gauge needle indicates low pressure	Abnormal
	● Same bubble appeared occasionally (1~2 sec. gap)	● Replenish the refrigerant ● High pressure pipe is hot and low pressure pipe is a little cool. ● H.L pressure of the pressure gauge needle indicates low pressure.	Abnormal

	Bubbles or foam visible	Trouble shoot	
	● No bubble shown High-pressure pipe is hot abnormally. H-L pressure of the pressure gauge needle indicates high pressure abnormally	● Too much of refrigerant deflate. ● High pressure pipe is not abnormal ● H.L pressure of the pressure gauge needle indicates high abnormally.	Abnormal
	● Refrigerant in the sight is shown clearly ● When engine RPM operates with high low some bubbles disappear slowly	● Normal refrigerant gas situation ● High pressure pipe is hot ● Low pressure pipe is cool ● High low pressure is normal with below. Low: 1.5~2.0kg/m² High: 14.5~15kg/m²	normal

5.Diagnosing malfunctions.

(1) Tracing faults

	SYMPTOM	CONDITION	CAUSE	REMEDY
1.Compressor	Abnormal sound	Inlet sound Outlet sound	Insufficient Lub.	Replenish
			Belt tension release	Adjust
			Release the bracket	Tighten the bolts
			Clutch fail	Check
	Abnormal revolution	Inlet cause	Damaged parts	Check,replace
			Slip the clutch	Check,replace
			Not Lub.	Replenish
		Outlet cause	Belt tension released	Adjust
	Refrigerant or oil leakage	Refrigerant or oil leakage	Sealing washer damaged	replace
			Head bolt released	Tighten the bolts
			D-ring damaged	Replace
	Excessive pressure	Low,High pressure	Insufficient refrigerator	Adjust
			Compressor	Replace

	SYMPTOM	CONDITION	CAUSE	REMEDY
2.Motor	Weak from pressure or don't work	Motor is normal	Air inlet clogged	Remove
			Evaporator freezing	Controlling minimum pressure
			Ventilator switch damage	Replace the switch
			Compressor	Replace
		Motor is abnormal	Motor failure	Replace
			Wire cut	Replace
		Air leakage	Duct leakage	Check,tighten
	Unable to control the fan	Motor	Air volume control switch failure	Check,tighten
		Motor is abnormal	Motor failure	Replace
3. Clutch	Noise	Regular noise	Interference with pulley	Control the compressor direction
		Irregular noise		
	Disengage	Engaged sometimes	Wire defect	Check wire
		Engaged to push with hand	Clutch gap large	Adjust
			Low voltage	Check battery
		No defect wire	malfunction	Replace
	Slip	Slip during rotation	Low voltage	Check battery
			Oil stick at clutch	Clean
			Malfunction	Replace

(2) How to check the air conditioning system with the needle of high low gauge

To connect with manifold pressure gauge can find the cause of air conditioning system.
 Because manifold pressure gauge is various sensibly (Ambient Temp. is based on 30~35°C)

Caution:
 Operating E/G RPM 1500~2000 is must, and so to that you can check the correct cause and air conditioning.
 (In case below the figure of indicated pressure gauge has some clearance, confirm with approximate indicated needle data.)

Gauge pressure conversion
 ● lb/in²=PSI
 ● 1 kg/cm²=14,223 lb/in²
 (Ex) 200 PSI=14 kgf/cm²

1.Normal

(a)	Pressure	• Low pressure : 1.5~2.0 kg/cm² • High pressure: 14.5~15.0 kg/cm²	Low pressure 2 Kg/cm² High Pressure 15 Kg/cm² 
(b)	Estimate	• Refrigerant condition good • Air conditioning good • Normal air conditioning system	

2. Deficient of Refrigerant Gas

(a)	Pressure	● Low pressure : 0.8 kg/cm²(Low) ● High pressure: 8~9 kg/cm²(Low)	Low pressure 0.8 Kg/cm² High Pressure 8~9 Kg/cm² 
(b)	Situation	● Deficient of air conditioning (Air duct is not cool) ● Many bubbles at sight glass	
(c)	Cause	● Refrigerant leakage in the air condition ● Clogged the expansion valve ● clogged the receiver drier	
(d)	Estimate	● Deficient of refrigerant and leakage in the air conditioning system	
(e)	Remedy	● Replenish the refrigerant and repair partially ● Repair the expansion valve and the receive drier or replace	

3.Too much the refrigerant

(a)	Pressure	● Low pressure : 2.5 kg/cm²(High) ● High pressure: 20 kg/cm²(High)	Low pressure 2.5 Kg/cm² High Pressure 20 Kg/cm² 
(b)	Situation	● Refrigerant condition is not good ● Never seen the bubble at sight glass	
(c)	Cause	● Much refrigerant ● Defect of the condenser	
(d)	Estimate	● Overcharged the refrigerant ● Defect of the condenser: Pin and the cooling fan	
(e)	Remedy	● Deflate the refrigerant ● Clean the condenser, and check the cooling fan belt	

4.mixed Air in the air conditioning system

①	Pressure	●Low pressure : 2.5 kg/cm²(High) ●High pressure: 23 kg/cm²(High)	Low pressure 2.5 Kg/cm² High Pressure 23 Kg/cm² 
②	Situation	● Deficient of cooling condition (Not cool) ● Not cool when touch the low pipe	
③	Cause	●Air was mixed in the air conditioning system	
④	Estimate	●Defect of the vacuum work in the air conditioning system	
⑤	Remedy	●Remove the vacuum and replenish the refrigerant ●Contaminated oil in the condenser: Clean and replace ●Replace the receive dryer	

5.mixed H₂O in the air conditioning System

①	Pressure	●Low pressure : Low~1.5 kg/cm² (Low or vibrate seriously) ●High pressure: 7~15 kg/cm² (Low or vibrate seriously)	Low pressure 50cmHg~1.5Kg/cm² High Pressure 7~15 Kg/cm² 
②	Situation	● Air conditioning is cool and is not periodically ● Manifold gauge pressure is occasionally down or normal	
③	Cause	●The expansion valve is freezing occasionally Mixed with H₂O in the air conditioning system	
④	Estimate	●Receive dryer is over-saturation ●H₂O was freezing in the expansion valve	
⑤	Remedy	●Replenish the refrigerant ●Replace the receive dryer	

6.Refrigerant doesn't circulate in the Air conditioning system

①	Pressure	●Low pressure : Negative pressure(Low) ●High pressure: 6 kg/cm²(Low)	Low pressure 76Kg/cm² High Pressure 6 Kg/cm² 
②	Situation	● Deficient air conditioning (Not cool) ● Cool occasionally	
③	Cause	●Clogged in the Expansion valve hole (Clogged by foreign matter or freezing, dust)	
④	Estimate	●Clogged in the expansion valve	
⑤	Remedy	●Remove the wet:Replenish the refrigerant ●Remove dust:Disassemble the expansion valve and clean with air lower and replace ●Replace the receive dryer:Leakage in the expansion valve replace	

7.Defect of the compressor pressure

①	Pressure	●Low pressure : 4~6 kg/cm²(High) ●High pressure: 7~10 kg/cm²(Low)	Low pressure 4~6 Kg/cm² High Pressure 7~10 Kg/cm² 
②	Situation	● Deficient air conditioning (Not cool)	
③	Cause	●Compressor inside leakage	
④	Estimate	●Defect pressure of the compressor (Valve leakage or damaged)	
⑤	Remedy	●Repair or replace
